CS> And to keep on topic, does anyone know when the new version of
CS> STZIP is due out? aparently v2.0 has a bug that creates bad crc
CS> files for over 40K :-(

I hope to release it for the new year ! I've had report for those CRC
errors but I've been unable to reproduce them (I've only been trying for a
few days since I didn't have my Atari before).
What configuration did you use and is the same file systematically
wrongly compressed ?

2. Compress.ARC

Newsgroup: comp.sys.atari.st
Date: 1993-01-01 05:42:56 UTC
From: rchan@terapin.com
Message-ID: <rchan.318s@terapin.com>
Source record: 212989

Well, people... I just downloaded compress.arc like everyone suggested. I am having problems getting it to run.

The program itself had a .prg extender, so I just run it... it just "hung." Then I renamed it to compres.ttp and passed "filename.ext" to it like it said in the instructions. It gave back "filename.ext.Z already exists; Not overwritten." and just "hung" again. Then I chopped off the extender and passed just "filename" and no messages... just hung there. I assume it crashed since the file was only 900 bytes, and I could not even get a keyclick... a sure sign of a crash.

Then I thought it might be NeoDesk and went back to regular desktop. Same thing happened.

Then I chucked the GEM altogether and tried a CLI (PCommand.prg) and typed the command "compress filename.ext" and the same thing happened.

Is this an old version? Should I be getting compress LZH or ZOO?

3. Looking for good deal on hard drive

Newsgroup: comp.sys.atari.st
Date: 1993-01-01 07:31:10 UTC
From: mmiller@nyx.cs.du.edu
Message-ID: <1993Jan1.073110.19806@mnemosyne.cs.du.edu>
Source record: 212991

I am looking for a good deal on a new or used internal SCSI hard drive, in the price range of $200 or less, 40 Meg. or higher. This price range does not include the cost of a host adapter. As far as a new drive, I would like advice on sources to look at with low prices and high quality. As far as a used drive, the newer the better.

Please e-mail to either of the addresses below. If there is enough requests, I will post a summary.

Thanks.

4. Falcon 030 Monitors/resolutions/colors/cards?

Newsgroup: comp.sys.atari.st
Date: 1993-01-01 09:24:53 UTC
From: afonseca@terapin.com
Message-ID: <afonseca.31bl@terapin.com>
Source record: 212992

Hi everyone.. I have a couple of questions about the Falcon 030 and the use of monitors for it..

I read that it was compatible with all VGA montiors, as well as the ATARI monitors and TV's, etc.. What I wanted to know is if it makes a difference, or how the computer reacts to larger monitors, or different resolution monitors.. Like a Multisync 5D, or a 19" monitor in color.

Does the size of the monitor change the amount of colors? Does the computer automatically adapt to the reslotuion of a big screen monitor? I am talking about true color mode.

In true color mode, does this mean the bigger the monitor the more colors? If not, what is the limit of colors/pallete? And are they developing any cards to use with the Falcon for 24 bit color or 32 bit color? Can the Falcon use a card to give it 16.7 Million colors on a 14' monitor?

When buying a Falcon 030, does bigger mean better? The Falcon Screenblaster card, is 800x600 I think, but how many colors..

I think they should make like a 1280x1280 16.7 million color card.. or something real high rez in order to compete or out-do the graphics on other platforms.

Thanks,

Alberto

You can use a version of the KA9Q package, of which there are several for
both the ST and the PC. You can specify the interface you wish to use,
which would usually be the serial port.

There is a new version at atari.archive.umich.edu in the telecomm directory
called n890421.lzh, though there are others as well. As for PC versions,
there are loads! You can definitely find one at ftp.demon.co.uk .

>etc...

>The pricing for clones is getting rather scarey, isn't it?

The pricing of clones is the reason the industry is suffering such a
nasty shakeout. (Didn't we do this in the mid 80s???) Many clone
dealers are making such minuscule margins on their chosen machines
that they can't afford to pay the bills at the end of the month, even
if they've sold MANY machines. (From my perspective, this is just
fine by me! I hope the clone market dries up and goes the way of
the dinosaur. Which is what it is, after all...)

10. Scheduler-type program for ST?

Newsgroup: comp.sys.atari.st
Date: 1993-01-01 15:38:49 UTC
From: ggreenbe@rodan.acs.syr.edu
Message-ID: <1993Jan1.103849.10186@newstand.syr.edu>
Source record: 212998

Does anybody know of a scheduler/calendar/alarm-type program
for the ST? (You know, something with a caldndar that you can
keep appointments in, with memos and alarms for meetings,
etc...sort of like the kind of thing that is part of PCTools.)
Maybe it would have a sort of electronic rolodex as part of
it?
Thanks,
Gerry
ggreenbe@rodan.acs.syr.edu

11. STReport???

Newsgroup: comp.sys.atari.st
Date: 1993-01-01 18:21:23 UTC
From: klasmekj@ucunix.san.uc.edu
Message-ID: <C06tno.Hxv@ucunix.san.uc.edu>
Source record: 212999

I thought this letter was rather interesting; however, I didn't write this letter and, therefore, can't take responsibility.

The letter came from GEnie Information Services.

How do _you_ feel about STReport? Do you think they editorialize or report information? Why?

December 1992

TO: Bob Brodie, Atari Corporation
Dorothy Brumleve, President - IAAD
GEnie FEEDBACK
Darlah Potechin, Atari ST RT
Members of the GEnie Atari ST RT
STReport

RE: STReport - My vote of no confidence (my opinions as well)

FM: Walter S. Wilson (WALLY.W)

History: ST Report (Silicon Times Report) is an electronically distributed weekly E-Mag.

The Publisher/Editor is Ralph Mariano; who also owns ABCO Computer Electronics "Full Line Dealer & Mass Storage" [1]. ABCO runs an average 8,677 byte advertisement in each ST Report issue (this constitutes an average of five to seven percent of ST Report).

ST Report has historically editorialized (reported) from the, "Atari is trying to pull a fast-one" point of view, and has a record of stretched facts, contradictions, and bullying folks who disagree or take issue with things they print. DoubleSpeak is ST Report's native tongue when pressed on most issues.

Onward: Recently, I've made myself aware of all the major complaints against ABCO Computer Electronics (also known as ABCO Computer Consultants). There are many, in fact, nearly as many as were lodged against Zephyr/etc.

Recently, I've seen STR (ST Report) writers ("editors") harassing the Atari ST RT sysops and others who might call them on the carpet for numerous issues.

Issues such as...

STR's Non-accountability to its reader base

STR's extremely lop-sided reporting of Atari-related items

STR's apparent agenda concerning Atari and Atari supporters

ABCO's "FREE" advertising in a pay area on GEnie via STR

Valid complaints about non-delivery of products from ABCO

STR's "quiet" stance in this issue concerning ABCO

The obvious conflict of interest concerning STR, Mr. Mariano, and ABCO

STR's unwillingness to actually report items that are public domain (FCC item regarding Class B for the Falcon030) [2]

STR's vindictiveness towards people who point out these things

ST Report's Publisher/Editor has an area on GEnie that is for letters to the editor of STR. Many issues of great concern are being touched on in this Topic, yet the Publisher/Editor doesn't address a single item.

This same Publisher/Editor (who owns ABCO), has a bad rating with the Better Business Bureau in his home state, has many very unsatisfied customers, has a FREE FLAG on GEnie in the ST RT, gets free advertising for his company under the guise of an E-mag in a GEnie pay area, and is completely aloof concerning any of these complaints.

It appears to me and others in the Atari community that Mr. Mariano is not "supporting" anything in the Atari community - except gossip and bad business practices.

To add to this debacle, his senior writer ("editor") is akin to the "front line" in his GEnie defense squad, and nothing posted regarding Mr. Mariano gets past Mr. Pulley (either with his "official" STR stance or his "my own opinion" stance).

It's gotten this ridiculous... In the ST Aladdin RT Mr. Pulley states as a fact that he _is_ leaving STR after the first of the year. Then in the Atari ST RT he and another STR writer ("editor") quibble over the fact that he said, "may be", and really hasn't made his mind up. This is just the beginning of the doublespeak in these issues. Who are we to believe; the ST Aladdin RT Lloyd Pulley, or the Atari ST RT Lloyd Pulley?

STR writers ("editors") continue to harangue Atari Corporation and Atari users in general over this Falcon FCC Class B approval. This is after these writers were told where the information was (that the FCC had the information - which makes it public domain). They (STR staff) are still trying to convince the world that Atari is trying to hide something...in the face of publicly available information to the contrary.

Thanks to Lloyd Pulley, posting under both his own "personal opinion" and his "official STR opinion" we've seen this incredibly drawn out harassment over "interpreting the rules" in the ST RT. Simply because he didn't like the fact that his objectionable message got deleted...now he's on this personal vendetta to police us all to death to make his point.

I remember when STR covered the Zephyr computer store's questionable business dealings. They did in in their best hybrid 20/20-National Enquirer fashion, and pulled absolutely no punches. Now ABCO is involved in the very same type of questionable business dealings, and still graces the pages of STR with no (I repeat, NO) scathing editorializing... As a matter of fact, hardly a peep at all. Obviously ABCO is receiving some sort of favoritism due to the relationship it has with the Publisher/Editor of STR. This is hardly an "independent" publication we are talking about...hardly a credible source for unbiased information. This is an obvious conflict of interest.

Even further back (and on several subsequent occassions) I can remember STR's scathing stance on mail-order places, and how they hurt real dealers. If ABCO is advertising in an E-mag that I receive in Sitka, Alaska, and they offer me ways of ordering through the mail...doesn't that make ABCO a mail order outfit also? These contradictions are rampant in STR's colorful history.

What I have the biggest heartache with is this: These people have free reign in the ST RT. They have free flags, and this gives them unlimited online resources to continue this kind of abusive activity...and apparently Atari Corporation and GEnie and the ST RT approve since they (STR and its staff) are allowed to do all this and still maintain free flags without being accountable to any of us for what they do, say, sell, advertise, etc.

Sincerely,
Walter S. Wilson

Truly incredible. You can find any excuse to not like 80x86 machines,
can't you? $1500 machine? Too expensive! $900 machine? Must be a
piece of junk if it's so cheap!

By your argument, I guess only the truly stupid would consider buying
a Falcon, since it's going to be offered at approximately the same
cost as that clone. Must not have good parts!

>Ahhh....we are talking about DOS-heads, tho, aren't we?

Now we're talking about insecure Atari owners who feel it necessary to
typecast anyone who buys an 80x86 machine, simply because it runs DOS.
Why don't you try running MACH on your Falcon, if Atari ever sells them
in the States, of course.

>I understand what you're saying about Atari and support... But Intel???
>GAG ME WITH A CLI! Intels are dinosaurs, there's no question about it.

Well, the dinosaurs can outperform everything Atari currently has out there, so I don't know what you mean. I'd rather have a dinosaur than a fossil, personally. Besides, one of the biggest arguments I see here is "my computer does what I want, so I'm happy with it and don't need anything else." By calling Intel machines dinosaurs, you make it clear that you don't believe this (otherwise why not be happy with a 1985 DOS machine?), so explain how you could possibly be better off with a 1985 Atari Fossil than you would be with a 1993 Intel-based clone than runs, oh, a hundred times faster.

>And the biggest stink about 'em is MS-DOS. As I've said many wheres else,
>if my cat shits on the living room carpet, I don't spray perfume on it.
>I clean it up. Ya know what Windoze is? Perfume! Perfume on stink.

Oh gee, and the GEM desktop is so much better. Give me a break. So Windows is a piece of shit -- don't use it! If you don't like DOS, get 4dos; it has command line completion, aliases, and lots of other good stuff that "real" shells have. "DOS" machines run more operating systems than any other computers these days. Don't bash the hardware because you don't like one of the operating systems.

>Now....Give me one of those new '486/100MHz machines and give it a UNIX
>o.s., and THEN we're heading in a reasonable direction!

Right, so why do you dismiss the clones when you know they can run better operating systems than Atari computers?

Interesting letter to be sent around at just this time. Atari's
usual "shoot the messanger" strategy in action. If it's such an awful
thing to have a free flag for commercial purposes on GEnie, how come
most of the free flag holders are commercial developers?
As with the latest letter in Znet which was published just after ST
Report dared print a reveiw of Comdex by an ordinary attendee who had
the audacity to say it wasn't a wonderful show, it seems Atari will stop
at nothing to silence ST Report. If this was sent to all attendees of
the Atari roundtable, this means the letter was tacitly approved by
Darlah, the roundtable sysop, as that is the only way the author could
get this dropped in every attendees mailbox.

Message-ID: <1i2bcjlNNekq@golem.wcc.govt.nz>
Source record: 212853

ST-ZIP seems to cause problems in:

Deflate compression mode
Slow (Maximum compression) mode

My configuration was a 1meg TOS 1.2 machine. I have a growing
susipicion that it may be a TOS incompability problem!

It only seems to cause problems on ZIPped files in excess of 40k - it
seems to work quite happily on smaller files!

I was also using the PRoGram version, not the .TTP version, although
I seem to remember both versions causing the same problem!

Well, someone from 'Unit-17' is around here somewhere, (where's that
8-voice tracker guys!? 8-)

20. Kosten

Newsgroup: comp.sys.atari.st
Date: 1993-01-01 21:13:22 UTC
From: geoffc@zebedee.uucp
Message-ID: <H.XtJiOXaBwjo@zebedee.uucp>
Source record: 212860

Does anyone know how to use the kosten program posted with Hermes, or
what it does ?

My german isn't good enough to understand the readme posted with it, but
I managed to work out from running it that I needed the LOGDIR environment
variable set to the directory where my uucico log file is. Having done this
I get the following output:

Kostenauswertung f&#65533;r die Hermes UUCP Software
V. 1.0, 1991, by Christian Reisel
V. 1.1.2, 1992, by Michael Bongartz
Problem: Das Logfile UUCICO enthaelt keine Tarifzonentabelle.
Bitte tragen Sie folgende Zeile als erst ein das Lofile ein:
TARIFZONEN: <Sek. zum Billigtarif> <Sek. im Normaltarif>

Help ?

21. Spectre GCR (Mac+ emulator) vs. Mac MS-Word 5.1???

Newsgroup: comp.sys.atari.st
Date: 1993-01-01 22:01:53 UTC
From: plucky@ais.org
Message-ID: <C073v6.H79@ais.org>
Source record: 212857
Cross-posted to: comp.sys.atari.st,comp.sys.mac,comp.sys.mac.apps,comp.sys.mac.misc

[Apologies for massive cross-post -- I'm at wits end!]

I'm looking for info from anyone who really knows MS-Word
for the Mac or the Spectre Mac-Plus emulator for the Atari ST.

I have an Atari ST (yeah, I know...) running a Mac-Plus
emulator called a Spectre GCR, with 4MB of memory (about 3.8 in Mac
mode), 60MB of hard-drive space in the Mac partition, System 6.0.8,
and an 800K floppy drive.

Microsoft Word 5.1 for the Mac, which I purchased at an
attractive academic price, requires the following:
* Mac Plus or greater (check -- as far as any program knows)
* Hard drive and one 800K drive (check)
* One MB or more memory, two for grammar or Sys7 (check)
* Apple System 6.0.2 or later, Finder 6.1 or later (check)

Well, I just tried to install my academically-priced Word 5.1
and the Installer tells me I don't meet the requirements for
installing Word 5.1. Neither "Easy Install" nor "Customize" is
available. What really ticks me off is that I installed and
then deleted an original 5.0 from the Mac Lab I work in at Michigan
State just to be sure it would work, and the 5.0 installation went
just fine!

You know what'll happen when I call Microsoft's help line --
I'll listen to their deejay for 15 minutes and then be told it's the
fault of the unsupported emulator. I'd almost rather pirate 5.0 instead.

So, I'm asking two packs of newsgroup readers two questions:
* COMP.SYS.MAC & c.s.m.APPS READERS: Does anyone know what
Microsoft changed between versions 5.0 and 5.1 that could be tripping
me up here?
* COMP.SYS.ATARI.ST READERS: Are there any Spectre users out
there using MS-Word 5.1 successfully? How did you do it?

I guess I'd also like any Atari/Spectre users out there who
have their Spectre manuals handy (I'm away from home, so I don't) what
the Gadgets By Small e-mail address is. I could call or fax tomorrow,
but I'm not entirely sure they're even in business anymore!

Thanks in advance for any and all help!

22. A Bomb in the Post

Newsgroup: comp.sys.atari.st
Date: 1993-01-01 22:05:30 UTC
From: cal@otter.hpl.hp.com
Message-ID: <78220002@otter.hpl.hp.com>
Source record: 212858

I have a problem which might appeal to the older Atari user. It is a bug which has been driving me nuts for years, and if I don't get a fix I'm going to fill my hard disk full of gunpowder and mail it to Atari.

First, the system. It is one of the "black brick" 520s with external power and an external floppy. It has been upgraded to 1 Mbyte. It has been completely, utterly reliable in every respect EXCEPT for the

Atari SH204 Hard Disk which I have had for several years, but rarely use because there is a bug in the system software which results in a partition being completely buggered on a regular basis. The symptom is that all the filenames become something like "zzzzzzzz.zzz", and most of the files are completely filled with garbage. I have to zero the partition to resume. It has happened on all my partitions at one time or another. It has happened three times today.

I am using the Atari supplied AHDI Hard Disk driver, dated 16th. June 1986. Is this the well known 40 folder problem? I am using an Atari supplied utility to add an additional 100 folders, and despite taking reasonable precautions to avoid encountering folders, I still get this bloody bug.

If this stirs a flicker of a memory, and you know of a fix, please let me know, and I'll donate some money to Greenpeace ;-)

You could always install onto your work computer, then copy the
newly installed files to your Atari using floppies (God forbid!)
or Appletalk. You will be in violation of your license for a
little while, but I don't think Microsoft wil prosecute you for it.

Hope this helps,
Mike

Message-ID: <1993Jan2.005603.17079@mnemosyne.cs.du.edu>
Source record: 212861

Greetings...

I grabbed the n890421 package from atari.archive, and I have it set up and it appears to work mostly. I can finger sites, and ftp to sites, but whenever I try to telnet I get 2 bombs. It never fails. I have tried numerous things to try and get telnet to work. I even rebooted with nothing in my autofolder and no desk accessories. That did not help either. Anybody else out there even trying the package taht can offer me a few pointers?

Source record: 212863

Okay, make sure you have the latest version of the AHDI utilities,
(not sure which version). Make sure you have FOLDRXXX.PRG installed
in the boot (Recommend setting it to at LEAST FOLDR300.PRG).

Using these two, should fix most problems. (If it will work, it would
be best to use the ICD utilities instead of AHDI, as they are updated
more often - and do more - whether it will work on your Hard-Drive
(the SH204) remains to be seen!

Anything dated prior to 1988 - try and find an update!!

26. Ultima 5 - Can anyone help!?

Newsgroup: comp.sys.atari.st
Date: 1993-01-02 01:50:00 UTC
From: wells_s@kosmos.wcc.govt.nz
Message-ID: <1i2sc8INNfps@golem.wcc.govt.nz>
Source record: 212864

Okay, after quite some time, for some odd reason, the U5.PRG file
in the AUTO folder of the Ultima 5 boot disk, has died. (The program
managed to overwrite it somehow with a saved game!)

I have looked on the disk, and it is *gone*! (e.g. I've used a disk
editor/undelete utilitiy to look at it - it's not there!)

If anyone with this game could UUencode and E-Mail this file to me,
I'd be *VERY* grateful! (I don't have a backup, as apparently making
backups for personal use is illegal). But, it's not a lot of use
without this file, and not a lot of use JUST with that one file,
(as it's only the booter - and there's another 2 disks, and other
data files on the boot disk).

Any help would be great!

(If anyone thinks I'm trying to pirate it somehow, then I can give you
word X of paragraph X page X or some such thing!
(I've got the map, coin, book, reference sheet, disks, and diary).

28. GNU SED v1.13 ported to Atari

Newsgroup: comp.sys.atari.st
Date: 1993-01-02 05:34:20 UTC
From: m91der@tdb.uu.se
Message-ID: <1993Jan2.053420.3932@tdb.uu.se>
Source record: 212896

I've just uploaded my port of GNU SED v1.13 to a couple of FTP-sites. If you're eager to get the file right away you can get it from /pub/atari/mint/sed113st.zoo at ftp.uni-kl.de. For those who aren't as eager and/or live in the US (and maybe thinks twice before opening a Transatlantic connection :-) there will also eventually be a copy of the same file on atari.archive.umich.edu (in the directory /atari/Mint). However, as a reply to my letter to Jeff Weiner I got an automated reply that stated that he was away during the holidays.

The port was made with GCC 2.3.1 PL1 and MiNTlibs PL25 and was very straightforward. I haven't had the opportunity to test all its functions, but the ones I've tested works as they were intended. I'm not sure how well the port works under plain TOS since I'm always running MiNT (but I can't really see any point in running it from plain TOS anyway :-). I also tried to compile SED with -mbaserel and -mpcrel, but somehow I couldn't get sed to run that way. It compiled and linked OK, but the executable only gave me a bus-error. It's probably some awfully silly thing that I'm doing wrong. I was under the impression that compiling with -mbaserel and -mpcrel would TRY to create a text-segment without absolute addresses. Am I missing something out?

Happy new year and f..k the army (I'm doing my military service right now ;-)!

>Maybe it would have a sort of electronic rolodex as part of
>it?

I use Calendar 6.3 by Bill Aycock. It's really, really good. It's shareware, so you have to send in money if you use it; mine's coming. :^)

It has a lot of features and I like its reminder feature much better than Cardfile's, which I also own. I put in appointments, meeting dates, and all sorts of stuff like that.

If you want the Rolodex, get Cardfile. It's excellent in its own right. Cardfile is commercial by Gribnif and it's up to version 4.03. I just don't like it's calendar section; I use Calendar 6.3 for that.

John Bunch asked about using telnet in the ST version of KA9Q.

I've been using KA9Q to telnet successfully for quite a while now. The only time I've had problems with it is when I have a RAMdisk installed, but that shouldn't affect you if you cold booted with a "clean" system..

The only thing I can think of to check.. is "start telnet" in your NET.RC file in the root directory of the drive you run KA9Q from..?

This is a known bug with this version, which has something to do with the
way that a site interrogates your machine to find out which type of
terminal it is.

The fix is to put 'echo refuse' in the 'net.rc' file. Everything should
then be fine.

ICD has several drivers out there for their host adapters and new LINK
but above that they are now providing a new driver for Falcon scsi
support so you can use Optical drives etc on them. I think its called
ICD BOOT PRO and is available through ICD at a small price. I think the
PRO version is the one you are looking for unless you need the link for
Full Scsi command set to hook up to your Atari.

Well Chris lets gets some facts straight!

1) I dont belong to the pirating group called Evil Force with over 1000 CD(compact disks), but you havnt denied being apart of it in Public? yet? I wonder why?

2) You flame Atari personel for not running Atari right but then you go ahead and copy anything in sight? Figure that out.

3) Im not parnoid of anything, but maybe you are worried about the truth coming out about your invlovement on 3 pirate BBSes in the Area! Why not go ahead and refute this statement and tell everyone which bbses you frequent and what they have online! I could help you out with large feeds of all the bbses you access and what you DL from them.

4) What does this have to do with what is being discussed is simple you are a hypocrite if you tell people on this system that Atari is to blame for everything when you in fact are part of the cause of the situation

5) It has been proven that equipment can fail do to power spikes across the telephone lines, thats why we hook up Surge protecters not only along the hydro lines but also the phone lines.

Now if you would be so kind and explain how you can be so active on a base for normal ST,TT or Falcon owners and yet go ahead and help groups like the Evil Force? I could give you and everyone a listing of CDs you offer to the pirate public if you like but I dont think many are interested in this kind of activity.

>which enables you to upgrade to KnifeST 2 when it becomes available"
>for 14.95 pounds.
>

As an old owner of KNIFEST, I can vouch that there certainly is
plenty of room for improvement!!

Admittedly I am used to a much earlier version than the 1.10 version
that recently came with ST-Format. In my opinion that "much heralded" package
was very lacking in useful features and tedious to use. Whenever I needed some
disk repair work done I tended to avoid KNIFEST and use instead the PD tools
e.g. FSCK by Georg Lohse and DLII and REORG by Simon Poole, and more recently
CLEANUP by ICD and some tools I developed myself.

Further, KNIFEST does not appear to understand BGM Partitions - and I
was dissappointed to note that this remains true even for this Version 1.10
- at least in some of the features I tried out. Apart from some tools I've
written for my own use, ICD's CLEANUP is the only disktool I've come across
that deals correctly with these. I have to admit however I found the booklet
that came with KNIFEST useful in explaining FAT & Disk structures - what a
pity that so few books on the ST go into this "vital" information in
sufficient depth.

I trust KNIFEST_2 will

i/ CORRECTLY deal with BGM Partitions

ii/ enable safety copies of both root directory FATS and subdirectory
FAT sectors to be saved to floppy in such a way that these can be restored
if a calamity occurs. That way all the old files that have not been damaged
can easily be located and tested and the saving of this "directory record"
should be so quick that one could afford the time to do it often (daily?).
This feature would have been invaluable to me in the past when I had a
very old and dicey hard disk. Now that I developed a tool with (partially)
this feature, I also acquired a more reliable hard disk - and so do not need
it so much!! - but still, it should be part of a Disk Utility/Repair Package.

iii/ incorporate some reorganising algorithm (like Simon Poole's REORG).
Of course, this must work with BGM Partitions also. (REORG itself predates
(I think) BGM and extended (32 Mbyte) partitions - and so will not handle
these correctly - any chance of an upgrade Simon? - like the one you did
for UNITERM not so long ago). Incidentally ICD should also incorporate some
defragmenting option into their CLEANUP (perhaps they've done so in more
recent versions than the one I've got?).

iv/ have a hard disk back-up option. I know this is unlikely as HISOFT have another package for this - but really they OUGHT NOT, as this task is so akin to the analyses that are germane to KNIFEST and (profit motive not forbidding) could so naturally be incorporated.

The original KNIFEST was merely marketed by Hisoft but developed by someone else (sorry I don't have his (Polish?) name to hand). Now it appears that Hisoft are attempting to patch it up. I hope they can do it better than the woefully inadequate telephone support answers I've got to questions concerning KNIFEST I posed to them in the past! If (as I suspect) their patchwork will NOT come up with the above (& some more) desirable features, I'm afraid that most will find that the most useful thing that comes with KNIFEST_2 will STILL be the booklet.

Sincerely, W. Alan B. Evans

Oh, this list would be very long :-)

To be seriuos: Many games have problems, but applications that work on
the TT will shurely work on the FALCON, too. And some that don't work
on the TT work on the FALCON, too.

I had similair problems, and the cause was a bug in the PAL that is
situated on the SH204 SCSI-Hostadapterboard. Since I got a replacement it has
worked perfectly for 3 years.

>Does the size of the monitor change the amount of colors? Does the computer
>automatically adapt to the reslotuion of a big screen monitor? I am talking
>about true color mode.

The resolution that appears after boottime depends on 2 things:
- The adaptor that is plugged in the FALCONS's monitor-port
- The resolutions you have choosen in the desktop.
All important resolutions can be displayed on all types of monitors (but
sometimes only interlaced). So it does not matter which monitor is connected
(14inch or 21inch for example, RBG or VGA and so on...)

>In true color mode, does this mean the bigger the monitor the more colors? If
>not, what is the limit of colors/pallete? And are they developing any cards to
>use with the Falcon for 24 bit color or 32 bit color? Can the Falcon use a
>card to give it 16.7 Million colors on a 14' monitor?

The size of the monitor does never influence the amount of colours you can
use. In TrueColor you have 32768 colors from 32768 colors, in other modes
you can use 256 colors from 262144 colors. The FALCON has an internal
slot for different kinds of extensions.

>When buying a Falcon 030, does bigger mean better? The Falcon Screenblaster
>card, is 800x600 I think, but how many colors..

As far as I know the same amount of colours, but more pixel and/or higher
refresh-rates (70Hz and more). (I'm talking about the OverScan-Card)

>I think they should make like a 1280x1280 16.7 million color card.. or
>something real high rez in order to compete or out-do the graphics on other
>platforms.

For TV/Video-applications 640x400 plus Overscan is exactly the right
resolution. Resolutions of 1280x1280 are only sensible on 21ich
monitors ($3000 and above :-)) I know some PC-freaks using 1100x800
on 15inch monitors. Normally the fonts they use are also only 16x16 pixels,
so they look like 8x8 on a normal resolution. I think that's crazy, but
they love it...

r>The program itself had a .prg extender, so I just run it... it just "hung."
r>Then I renamed it to compres.ttp and passed "filename.ext" to it like it
r>said
r>in the instructions. It gave back "filename.ext.Z already exists; Not
r>overwritten." and just "hung" again. Then I chopped off the extender and
r>passed just "filename" and no messages... just hung there. I assume it
r>crashed

If you want to compress a file in TOS, you should give a filename without
an extension like this, otherwise it will try to create filename.ext.z,
which is not allowed in TOS (unless you use UNIXMODE):

compress filename -> creates filename.z where filename.z
is compressed

If you want to uncompress a file in TOS, it should have the extension .z
and you must do the following:

compress -d filename.z -> creates filename where filename
is uncompressed

Ciao, Stefan.

50. Archiver wars (was Re: We have reignition)

Newsgroup: comp.sys.atari.st
Date: 1993-01-02 18:15:13 UTC
From: cbbrowne@csi.uottawa.ca
Message-ID: <1993Jan2.181513.4659@csi.uottawa.ca>
Source record: 212886

I) Concerning lharc:

I never use it for anything other than file extraction, so I don't know all of the inter-version compatibility features. However, as a thought:

Most archivers allow the option of forcing the use of some particular compression method, or the use of archives compatible with some "older" edition.

Is lharc an exception to this rule? If not, then why don't the people that package up newer versions use the "compatibility" option? It seems only sensible: I don't care if the archive bloats by a few K, as it only gets downloaded ONCE. The few K of savings by using some newer algorithm will be FAR exceeded by the cost of the fact that people wind up having to download two or more different versions.

II) Concerning other options:

On the Atari ST, there seems to be quite the choice of archivers:
- Zoo
Roger Sheppard may hate it, but at least it has remained STABLE, doesn't crash, and is highly compatible between a variety of platforms. Compression sizes are competitive, which makes up for the fact that it's a little slow.

I consider it a GOOD thing that it hasn't changed much in a couple of years.

- Lharc
There's lots of work going into maintaining/improving Lharc, but unfortunately, it's all quite jumbled, and it's almost impossible to guarantee that you've got a compatible version. It's fairly fast, but that's because it gets hacked on a lot, which makes it less trustworthy.

- ARC
It's occasionally needed for compatibility with OLD archives. Unfortunately, it's fairly slow, doesn't compress nearly as well as the competition, and the support for subdirectories is a little spotty.

- ZIP
There has been an attempt to get ZIP running on the ST. There's a nice GEM-based version, which unfortunately is buggy. (I've only once gotten through a session with out bombs.)

If you watch the traffic around gnu.announce, and comp.compression, there seems to be quite a bit of talk about a new "portable" edition that's available pretty much in the public domain.

The GNU people are planning to use the ZIP algorithms as the standard compressor for the GNU project; clearly the code is getting looked at by many people in many places.

I could see it being an idea to try to latch onto this use of ZIP, and try to make it into the #1 Atari archiver. ZIP is now about as portable as ZOO; if they get a VM/CMS version out, it will be MORE platform independent than ANY other archiver.

Given the great popularity of ZIP in the I*M world, the fairly easy availability in the UNIX world, as well as VMS, VM/CMS, and probably other places I can't think of, and the fact that early versions of ZIP have been fairly well received by Atari users, it might be worth some of us putting effort into getting the "new" ZIP properly compiled, and generally accepted on the Atari. It might end the LZH/ZOO wars, at least.

Source record: 212897

Luckily, the ST's built-in GEMDOS and XBIOS functions have no problem dealing with 10-sector, 83-track formats. It's the 11-sector format that required messing with low-level disk functions (VERY ugly).

floprd(long a, 0L, int d, int s, int t, int si, int n)
flopwr(long a, 0L, int d, int s, int t, int si, int n)
flopfmt(long a, 0L, int d, int s, int t, int si, int i, long magic, int virgin)

a = address to buffer
d = disk drive number (0/1)
s = sector number; with flopfmt it contains the number of sectors/track
t = track number
si = side (0/1)
n = number of sectors to be read or written
i = interleave (usually 1). determines the order of the sectors within tracks.
magic = $87654321 (a constant used for formatting)
virgin = intitial value of sectors (usually $E5E5). Can be any number as long as the high nibbles are not F.

In addition to using flopfmt, you must write a bootsector to the disk. I'll have to find the relevant info, but I recommend you look in some book that covers XBIOS and GEMDOS (e.g., Compute's Third Book, ST Drives Inside & Out, a good C manual, etc).

>only time I've had problems with it is when I have a RAMdisk installed,
>but that shouldn't affect you if you cold booted with a "clean" system..

What kinds of problems were those? I've never had any trouble of this sort.
(Hm. How much RAM in your setup?)
>
>The only thing I can think of to check.. is "start telnet" in your
>NET.RC file in the root directory of the drive you run KA9Q from..?

The various "start" commands are for starting up the servers that handle
incoming connection attempts. When you say "telnet blah" you're invoking
the telnet client to make an outgoing connection. The two are independent
and will have no effect on each other (unless of course, you're trying
to telnet to yourself...).

The bug that John refers to is mentioned in the ReadMe that accompanies
the n890421 package. Oddly enough, it seems to be based on the same code
that my port was based on, but includes support for many more protocols.
Doesn't seem to do SLFP or PPP though.

There are many Atari employees who read Usenet. There are some who post to Usenet (I'm one of them). Those of us who do generally try to avoid getting involved in threads that are "no win" propositions, or about which we don't know the details. I understand that David is upset at Atari; I wasn't around when he was here, and so I can't comment on what happened during his visit. But I can assure him (and anyone else reading) that Atari employees do care about the people who own our computers. Indeed, most Atari employees I know own an Atari computer.

I am not an Atari spokesperson, nor do I have anything to do with marketing or manufacturing (so don't bother flaming me about our problems in those areas... which the appropriate people do know about, and are taking steps to ameliorate).

Forget it, it's only usefull in good old germany.

>TARIFZONEN: <Sek. zum Billigtarif> <Sek. im Normaltarif>

Add 'TARIFZONEN: seconds for one cost unit' as first line of uucico and
it will work. Nevertheless it's only calculating with german 0.23 DM.

Better use cicolog, it's configurable on other fees than german 0.23 DM

OS/2> this group for a good laugh. However, I had to give Bob some support.

I'll throw in my support as well. How many of you guys remember when
Bob Retelle was one of Atari's biggest boosters on GEnie back in the
mid 80's? In spite of all his whippings at the hands of those
bumbling buffoons in Sunnyvale, he still seems to spend a significant
amount of time on this group helping out pigeo...um...new users with
problems and such.

It is truly a sign of things to come when you see the Baggetts, the
Retelles, the Johnsons, the Eisvogs (I know I didn't spell that right)
and yes, even the Darek Mihokas and Ignak Kolenkos disappear from
the Atari scene. These guys often went above and beyond the call
of duty to get out quality products to the Atari community. Let's
face it, there's no reason for these talented people to hang around.
There's no money in supporting Atari products and there's not only
minimal support from Atari for developers, but they even go so
far as shitting on the few knights of the Fuji table who are still

around.

Atari's balance sheet and sales are the laughing stock of the computer world and Wall Street. Their products are not even close to being on the cutting edge of technology anymore, nor are they a good bargain (once you add a usable amount of memory, disk, and a decent monitor to it). It has gotten to the point where Atari could start selling a capable machine (perhaps a 68040-based Falcon) and they wouldn't be able to find anyone to write software for it.

The fat lady is taking a deep breath and preparing for one hell of a song. Start saving up those Atari stock certificates, they'll soon make great kitty litter. Actually, that would be a great idea for you militant disaffected users. For $20 bucks you could buy enough Atari stock (at about one dollar a share) to make a respectable amount of kitty litter. Let your cat use it for a few days and then start mailing it to Sunnyvale. :-)

Cheers,

Chris

g>V. 1.1.2, 1992, by Michael Bongartz
g>Problem: Das Logfile UUCICO enthaelt keine Tarifzonentabelle.
g>Bitte tragen Sie folgende Zeile als erst ein das Lofile ein:
g>TARIFZONEN: <Sek. zum Billigtarif> <Sek. im Normaltarif>

I'll translate...

Problem: The logfile UUCICO doesn't contain a table for phone line costs.
Please add the following line into the logfile as _the top line_:

TARIFZONEN: <seconds in cheap times> <seconds at daytime>

This might not be suitable for countries other than Germany, where phone costs
are calculated this way. Just enter something like

TARIFZONEN: 42 21

if you don't care about costs :-) or in case you have no such system.

d>but above that they are now providing a new driver for Falcon scsi
d>support so you can use Optical drives etc on them. I think its called
d>ICD BOOT PRO and is available through ICD at a small price. I think the
d>PRO version is the one you are looking for unless you need the link for
d>Full Scsi command set to hook up to your Atari.

Well, fine fact. The PRO level seems to be the one that doesn't require an ICD host adaptor connected.

Besides, the combination AHDI 6.03 and HDX 5.01 works fine for any drive I tried so far, on all machines with SCSI port.
This includes 128 MB Sony MO, 88 MB Syquest, various fixed HD drives.
Streamers will require special drivers for their purpose.

The only problem you might have on ACSI based systems is that Atari's software cannot recognize 'big' drives (above ~120 meg) without a matching line in the WINCAP parameters file. ICDs software will format and partition correctly, without manual work.

Hi,

>I never use it for anything other than file extraction, so I don't
>know all of the inter-version compatibility features.
I'm using a little bit more, I do all my archiving stuff with LHArc.
I'm connected to several German file networks for the atari and we do
not have any problems with incompatible files. The traffic is a little
bigger than c.[bs].a.s, almost everything is packed with lzh. No problems
here...

[thought: compatibility mode]
>Is lharc an exception to this rule?
No, just add -o to the command line to create old archives. But I don't see
any sense in it: If your 20 year old TV set is broken, there is almost no
chance to get any replacement parts. Now imagine you would go out and tell
all company producing TV sets: "Hey, I want you to produce my 20 year old
TV set so I can get replacement parts!". Thats nonsens, isn't it. You will
have to buy a new one.
On the other hand, your years-old LHArc version is uncapable to unpack
archives created by newer versions. And you go out say "Hey, I want you to
use the old compression method". A new LHArc version is available for free
(if not, drop me a mail. I'll send it to you. This applies to everybody out
there with a useable address [I do hate !-adresses])...

>- Lharc
>There's lots of work going into maintaining/improving Lharc, but
>unfortunately, it's all quite jumbled, and it's almost impossible to
>guarantee that you've got a compatible version. It's fairly fast, but
>that's because it gets hacked on a lot, which makes it less

The MegaFile 30 and 60 are exactly same except for the capacity of the disk
itself. It's news to me that a megafile 30 is unreliable, and I've owned one
for several years. (I sold it when I got a MEGA STe with an internal drive.)

As for the complaints in the original message, they sound to me like some sort
of resonance of the casing, and I wouldn't worry too much about it.

Well CAL63.ACC does an excellent job and has most of these features. You need HotWire to use the alarm feature though. It doesn't have memos but everything else. It's shareware and should be at atari.archive.umich.edu. If you want a commercial product NeoDesk has CardFile 4 which has an address book, personal notes, phone dialer, mailing labels, daily agenda and appointments and a monthly calendar. It costs $29.95US from Gribnif Sofware P.O. Box 779 Northampton, MA 01061, Phone (413)247-5620. I don't have this program but do have NeoDesk and it's an excellent product.

Message-ID: <1993Jan3.4514.28574@dosgate>
Source record: 212607

In a previous message you mention you dont own a colour monitor, then the next message you do admit to owning one plus have lots of games. I think you have convinced the Usenet people you not only make false statements but you also pick up games from the local pirating group called the Evil force.

I hope you leave the atari platform because soon as we get rid of more of the pirating types on our machine the better off we will be. I think what you are really upset about is that many of the pirates have and are leaving the atari platform which is a good sign! To bad you are running out of files to UNMSA on your pirating bbses. Glad the pirating boards are slowly dieing and leaving to other machines.

When you list some of the things you do why dont you mention the opposite things you do that dont help atari? Why do you avoid answering which bbses you support, which files you download, which games you bought rather than copy, which software you really support rather than pretend to be a follower of shareware or PD software. Let the truth come out!

Michael Forget wrote about his Megafile making noises..

There are two sources of such noises normally.. the first is a
"head crash" where the flying read/write heads make contact
with the spinning disk and gouge the surface of the disk.
The material scraped from the surface will cause secondary
crashes until the heads and surfaces are destroyed. The noise
from a head crash will usually be a scraping and grinding sound.

You do NOT want this to happen..! :)

The second source of noise is a "ground strap" which serves to bleed
off static electricity which would otherwise build up on the spinning
platters. The place where this strap contacts the end of the axle
tends to wear, allowing the strap to vibrate and make noises.

This is not destructive, only annoying.

There are ways to dampen the vibrations of the ground strap, but they
require disassembly of the case, and possibly removing the pc board
on the bottom of the hard drive itself. If you can get to it, a small
blob of silicone sealer on the *outside* of the strap will often cure
the noises.

(A third source of noise could be failing bearings in the cooling fan,
but it would be pretty obvious where that noise was coming from.)

In the case of a head crash, you'd know it very soon, as the drive would
become unreadable, and there would be many errors.

From the description of the symptoms, and especially because the noise
changes with the orientation of the drive, it sounds like the ground
strap to me...

The reason I get tired of reading the messages from Bob and Dave is that they keep saying the same things over and over and over. I was a reader of Bob when he was on GEnie, and I was around when he left too. My problem with a lot of the folks' messages here is that they don't seem to be able to differentiate between the compter and the people who run the company. I have two Atari's, a Stacy 4/40 and a 12meg SSTed Mega. They both work just fine and do everything I want to do. I have about 250 disks of softwar and its cheaper and does more, easier, in my opinion than the stuff I have had to use at work on the IBM and the Mac. I don't have to love the management of Atari to enjoy using the computers their company built. I used to enjoy the technical information I got here on the net, but now it seems most of the bandwidth is being wasted on company bashing and nowbody is talking about the the machines. Frankly I don't care if Atari is full of (censored) people as long as I can keep my machines working. If they die and atari is gone, I'll buy a machine which works as close to the way my Ataris did as possible. i.e. a built in GUI, OS in ROM, good monochrome display, reasonable speed, price, and _simple_ to set up. Don't anyone try to tell me its a simple thing to set up an configure a clone from scratch. I've had to help too many people who weren't beginners do it. If the machine doesn't come with windows installed already it can be a nightmare for a beginner.

From : DARLAH [RT~SYSOP]

Jon:
Do me a favor (no internet connection here) and let the good folks know
that we don't agree or disagree with everything in our library. If we
did, that would mean that we sanction each and every article in the online
magazines. What we do offer is the freedom of speech. We do take great
strides in making sure our files work and are virus free as well as not
crossing over any legal lines. We do try. :-)

Personally, they appear NOT to have the entire thread to make an accurate
judgement. That is too bad. They really need to get online or obtain the
ENTIRE thread to make any conclusions. Unfortunately the lack of such
doesn't seem to stop some people. Flags are given to people to give
online support.

I was the very 1st person to obtain such for GEnie and to make GE aware of
the benefits. It is a successful project. It is obvious they have
absolutely no idea what they are talking about in this regard. Atari
doesn't run this RT, I do. I make all final decisions. I don't play games
and base my decisions on personal feelings. I actually have better things
to do than invest my time in those sort of games. I wish everyone did.

76. A little story from OZ

Newsgroup: comp.sys.atari.st
Date: 1993-01-03 23:16:02 UTC
From: swanee@megadata.mega.oz.au
Message-ID: <1993Jan3.231602.25684@megadata.mega.oz.au>
Source record: 212616

A little story from down-under ...

A friend of mine who deals in computers (PC clones, ataris and amigas)
had someone come to him last week with a 520STFM that had the 1MB
upgrade and was working OK except for the floppy which needed replacing.
My friend gave him a quote to fit a double-sided floppy to his machine
for A$100. This guy ummm'd and arrr'd for a while and then said that
if my friend gave him A$60 he could have the machine. He ended up
refusing the deal because apparently you just can't unload atari machines
here anymore, even if you give them away!

Sla/n go fo/ill,
Risky B.

77. Is 1st Card still around?

Newsgroup: comp.sys.atari.st
Date: 1993-01-03 23:34:13 UTC
From: jrt@hardy.u.washington.edu
Message-ID: <1i7t5lINNr8b@shelley.u.washington.edu>
Source record: 212614

I ran across an application called 1st Card about a year ago.
It was similar to Hyperlink, allowing data and graphics to be
used in a database construction. I would be interested in
hearing from anyone who has had experience in using it, or
cross references between it and Hyperlink.

It is also supposed to support an expert shell, which would
be very beneficial to the type of application I plan to write.
This program evidently won an award for the most innovative
new educational software in Aug. 1991, so it seems there should
be some facts about it soomewhere, and perhaps a demo??

Thanx,

Jerry Thompson

: That's not true.
:
: *.Z --> use uncompress
: *.F --> use freeze -d

And while we're discussing extensions:

*.z (lower-case) --> use GNU ZIP

It's supposed to become the new standard for the GNU-project. I can now
see LOTS and LOTS of people wondering where to get an Atari-version of
GNU ZIP (well, I hope at least _someone_ wants to know :-). Just watch
this newsgroup the next couple of hours and you'll know. I just finished
the port and is now putting together a simple readme-file.

79. For sale: Okimate 20 printer, Printmaster Plus, EasyDraw

Newsgroup: comp.sys.atari.st
Date: 1993-01-04 00:44:47 UTC
From: georgew@tekig1.PEN.TEK.COM
Message-ID: <8130@tekig7.PEN.TEK.COM>
Source record: 212617

Printmaster Plus $15
Make greeting cards, etc. Works with most 9-pin printers and Okimate 20.

EasyDraw 2.0 $15
Drawing program from Migraph. Works with Epson FX and Okimate 20.

Okimate 20 color printer $60
My kids used this a lot for color screen dumps when they were younger, but they're into DTP now, so I bought a 300 DPI printer. This is the Atari ST version of the printer, which emulates Atari SMM804 graphics (basically Epson 9 pin) as well as doing color screen dumps and 24-pin NLQ text. Included: 2 1/2 black ribbons, 1 1/2 color ribbons, and about 250 sheets of fanfold paper. Does *NOT* include printer cable (it uses a standard Centronics cable - about $10 from any computer store). Also, the current print head has one of the 24 pins burned out; new ones cost about $20 by mail order and just snap into place. I'll enclose an order form from the company that sells paper, ribbons, and print heads.

All of the above come with original boxes and manuals, and I'll pay shipping in the continental U.S. (I live in Oregon.)

81. GNU ZIP v0.6 ported to Atari

Newsgroup: comp.sys.atari.st
Date: 1993-01-04 01:59:24 UTC
From: m91der@tdb.uu.se
Message-ID: <1993Jan4.015924.26763@tdb.uu.se>
Source record: 212627

I've just finished a quick and dirty port of the latest GNU ZIP (v0.6).
You will find it at atari.archive in the near future, and at ftp.uni-kl.de
when you read this (/pub/atari/archivers/gzip06st.zoo). It looks like
FSF will use GNU ZIP instead of COMPRESS in the future in the GNU-project.
That means a LOT of people will start using it fairly soon, so why not be
one of them? :-) Anyway, GNU ZIP does compress a lot better and it will
eventually support the immensly popular PKZIP-format (from the PC-world).
It already suports multiple-file archives (something COMPRESS never did).
For more information on what is planned for future GNU ZIP-releases please
take a look at the TODO-file in the original source-distribution (see below).

In the archive you will find two different executables. One that should
run fine under for example MinixFS (called gzip_xfs.ttp) and one that
I compiled so that it shouldn't use symbolic links, multiple dot-filenames
or try to change the owner of the file (called gzip_tos.ttp since I
believe there's a small chance it will work on a normal TOSFS). Neither
of the two programs has been tested _without_ MiNT installed, so if you
try to run them from plain old TOS you might run into big problems. The
two executables has been built by GCC v2.3.1 PL1 with MiNTlibs PL25 (if
anyone is interested :-).

You will also find the original README file, the COPYING file, a small
document describing GNU ZIP and the makefile I used when building GNU
ZIP on the Atari. The original source-distribution can be found at your
local gnu-ftp-site or at prep.ai.mit.edu as /pub/gnu/gzip-0.6.tar.Z. In
the source-distribution you will also find a couple of shell-scripts that
could come in handy when dealing with packed files. There's also some more
documentation concerning the algorithm and a man-page.

Share and enjoy!

84. MiNT and MINIX file system

Newsgroup: comp.sys.atari.st
Date: 1993-01-04 05:01:53 UTC
From: lehmann@cs.tamu.edu
Message-ID: <1i8gc1INNqb5@tamsun.tamu.edu>
Source record: 212620

Well I finally installed the MiNT distribution kit. I had to do it manually. I think that I had the MINIX file system working too. I placed the file "MINIX.XFS" in the root directory of my boot drive "C:\" and I got the message that the MINIX file system was active.

I then wipe everything about under normal TOS by simply copying a file to the partition that stores the MINIX partition.

My questions are:

What do I do to prevent TOS writing onto the MINIX file system when MiNT is not active?

I am supposed to be able to make large file names with MiNT and MINIX? I could'nt find a UNIX like program that would let me have more than the TOS sized file names. When I did "touch thisisamintfile" the system locked up. No error messages. Maybe the program could be slow, but I waited about 10 minutes for it to complete. I thought that "touch" would be extremely fast.

Use the ICDFMT.PRG partition program, what should I set in the "TYPE" field. I know that in real MINIX I should somehow make the partition unavailable to TOS only. How do I make a partition MiNT accessable and not TOS accessable?

System Information: TOS 1.0 / 4Mb RAM / 193 Mbyte hard drive / ICD controller / 1 embedded SCSI drive / 1 Adaptec RLL drive / Empty AUTO folder / No Accessories except TOSWIN when running MiNT

Does anyone know is TOS 2.06 is a good system for running MiNT? I want to either get TOS 2.06 or NeoDesk 3.x. My TOS 1.0 and NeoDesk 2.05 combination just doesn't cut it.

Does anyone know is Universal Item Selector III is supposed to work with MiNT? I have tried many kinds of AUTO folder combinations to get UIS III to work, but the configuration usually bombs upon the first call of the Item Selector.

Which I believe is massively unfair since most Atari users are NOT on GEnie or Compuserve. I realize that this might be different in the U.S., but this just shows how ICD fails to perceive international markets. (And I'm willing to bet that they sold five times as many adapters in Germany than in the U.S.)

> If you have a local ICD
>dealer they can also upgrade your software for no fee (if they will).

That's the point. They charge DM 20 (some $13) for the new software. While this may not seem much, keep in mind that there have been quite a number of revisions of the (IMO very good) ICD software, and you cannot always know which version solves your particular problem.

To be fair, there IS the possibility to d/l their software from a mailbox in Germany, but the long distance phone charge would be even more than DM 20 :-(

Yet another example how US mfgrs ***** their European customers.

there's an ICD mailbox (no net, just one box) here in Germany where you can
download the new versions. The phone number is +49-6104-67582, the modem is
probably a HST (I do have 14400/HST connects)....

>If you have a local ICD dealer they can also upgrade your software for no
>fee (if they will).
That's slightly different here in Germany: Each and every update is 15 DM
(approx. 10 US$) if you get it at ICD, for free at the box. And the phone
costs are lower than that fee :-)

>
>My questions are:
>
> What do I do to prevent TOS writing onto the MINIX file system when
>MiNT is not active?

I don't think you need to worry about this. Usually a Minix formatted
filesystem will have a valid TOS boot block, with the FAT configured to
indicate 0 sectors free, thus preventing you from writing anything to it.

> I am supposed to be able to make large file names with MiNT and MINIX?

>up. No error messages. Maybe the program could be slow, but I waited about
>10 minutes for it to complete. I thought that "touch" would be extremely
>fast.

The programs need to have been written correctly in the first place, i.e.,
allow for file names longer than 13 characters. If you have a program that only
allocates 14 bytes for filenames (as most TOS programs do) and the directory
routines return a filename much longer than this, you're bound to corrupt
your memory. Depending on whether the program stored the name in a local or
a global/static variable, you could trash the program's stack or other data
areas. If the stack is trashed, the sort of lockup you observed is not unusual.

The minixfs.doc file says the partition type must be GEM, therefore, you
cannot make the partition hidden to TOS.

Yes it is. It runs well with MiNT, but Mupfel, Gemini's shell, does not yet support MiNT's features. (From what I gather from the Mausnet's Gemini newsgroup, the next version will.)

Vincent Partington asked which is the newest version of Gemini and he can get it from. The last released version is 1.21, it should be on atari.archive.umich.edu.

Never ever use these prpgrams to fix hard disk problems,(FSCK-DLII/REORG) they
have more bugs that Bugs have..

> Sincerely, W. Alan B. Evans
> [wabe@ukc.ac.uk]

CleanUp it nothing like KnifeST and I found that it failed with a hard disk
problem, that Ataries CHKDSK3 showed up, cross link clusters..???

Problems that I have found with KnifeST 1.07..

1. No insert mode for the edit buffer..

2. Backspace and Delete keys don't work in the edit buffer..

3. Unable to print a FAT Table Page, only the lot..

4. Will not show Folder/Directory cluster links..

I find that PD software is a Big wast of time, like playing Russian roulette
with you Hard Drive..

BGM Partitions, I think Atari took to long in bringing out a standard,
is it one,? and most other hard drive firms ended up developing there own..

Does any one support BGM Partitions..??

Message-ID: <HMITCHEL.93Jan4072830@vlasov.gsfc.nasa.gov>
Source record: 212636

Hi,

I just replaced an old 520ST with a 1040STE. Most games and applications seem to run fine, but one troublesome exception is Headstart. Does anyone know of an application for an STE auto folder that will put up a user-configurable menu of (GEM) programs that a user can pick from? Such a utility is invaluable when producing turnkey disks for kids.

By the way, can someone explain the AUTO folder part of the INSTALL APPLICATION menu dialog? I tried to use it to establish an auto-booting GEM program, but it seemed to have no effect.

Thanks,

98. Spectre GCR on a TT

Newsgroup: comp.sys.atari.st
Date: 1993-01-04 12:32:35 UTC
From: mike@medsun.unige.ch
Message-ID: <1993Jan4.123235.19935@news.unige.ch>
Source record: 212637

I have just become the proud possessor of a TT with a large colour monitor (Eizo) and Crazy Dots, and I have two problems (that I have found so far) with Spectre GCR 3.0.

1 - I cannot format 720 k MFS floppies with DCFormat 3.02, for transverting (I always get a disk error);

2 - I cannot get a full A3 Mac screen - the Mac does run on a 1280x800 screen, but it gives me 2 "squished" (and illegible) screens, side by side. In ST high res. emulation, there is no problem.

Thanks in advance,
Mike

>his screen redraws take place at a reasonable speed.
>
>I am DAMN glad I did not buy into the PC market - I like my money
>in my account and not spent on hardware upgrades (I won't even
>begin to detail the cost of software upgrades on a PC).

Like every other Atari bigot, you're spreading half truths again.
You're trying to tell me that you get 1024x496 resolution out of
your Sm124 mono monitor? Right! When pigs fly! I'm sure you meant

the SM194 24 inch mono monitor?? That's a much more expensive
proposition. Would you care to tell me how much a typical Mega ST
user would have to pay for sure an upgrade and why this is such a
better upgrade path than a PC user paying $200 to upgrade from a
standard VGA card to a 1024x768 Super VGA card?

****
* Yes, dink head; I do get 1024x496 on an SM124. I own the damn *
* monitor and unlike you, I **DO** know what I'm talking about! *
****

Also, the Mega ST can't be "stock 1985" since they weren't released
until late 1987! If you do have a stock 1985 machine, which can only
be a 520ST, I'd like to know how someone goes about upgrading that.
Adding RAM is a pain and you have no expansion slots for graphics cards.

****
* Learn to read bozo; my posting quotes my 1987 MegaST. Not only *
* are you an arrogant idiot, you also appear to be illiterate *
****

As for waiting for the Falcon, well, sweet dreams. Obviously Pagestream
can't be THAT slow if you're willing to waste another 6 months waiting
for the Falcon.

****
* 6 months is the time it takes for screen redraws of Windows on *
* a 386SX. You must be real patient to be a PC user *
****

You also don't seem to mind the disposable computer mentality of Atari.
After all, when you buy your Falcon, you won't have any use for the
hardware inside your Mega ST.

What your close minded little message doesn't point out is that most
PCs (or Mac or Amigas for that matter) are not disposable computers
like the Atari ST is. An upgrade typically involves replacing a card
or plugging in a new card, not throwing away the whole computer and
buying another one.

****
* The paragraph above is just PURE bullshit *
****

You're ignoring the fact that most of the PC components can be reused
such as the keyboard, power supply, SIMMs, floppy drives, hard disks, etc.
An XT or AT user can for about $400 replace his existing motherboard
with a 486 motherboard and not throw away the rest of the computer. This
is analagous to replacing your existing 68000 chip with a T20 or SST
upgrade, but simply upgrading your ST to a 68030 (for about $1000) won't
get you TOS 4.0 or the improved graphics resolution of the Falcon. Your
only choice like you said it so wait until the Falcon comes out and then
buy a brand new computer.

```
*****************************************************************
* Hey dopey - I have a 386@40MHz sitting on one of my desks at *
* home. I sell these to anyone who wants them (in addition to *
* selling Atari computers). I MUCH prefer to use my Mega than *
* struggle with the 386. Windows, my dear boy, is a VERY poor *
* excuse for a modern, user-friendly interface. Now, being the *
* MS running dog lackie that you are, I hope that statement *
* makes you penis shrivel right up! *
*****************************************************************
```

>My only problem right now is slow redraws with Pagestream. I
>could get a T25 board but I think I'll wait for a Falcon. I
>don't mind the move from an ST to a MegaST to a Falcon since
>it is not analogous to the PC scenario. First, the cost of
>the upgrade will be lower overall (and spans 7 years
>altogether - got my first ST in June 1985). Second, MOST of
>my software should be usable as is (unlike the upgrade from
>DOS based to Windows based applications).

What kind of bogus logic is this? You're telling me that a PC user MUST upgrade to Windows and buy new Windows software??? Why, like all his existing DOS software immediately stops working? Or Windows doesn't run DOS software (which it does). So what exactly is the point you're making in the paragraph above. I am missing it. Windows is only installed on about 20% of the PCs out there. That means that 80% of your PCs are still booting up good old DOS and probably running in text mode, just like most 520ST and 1040ST machines probably aren't running TOS 2.06, aren't running Multi TOS, and aren't running a We'll ignore the fact that the upgrade to TOS 1.4 was pretty well mandatory if you wanted a usable ST, since TOS 1.0 was about 30% at screen redraws and had those horrible hard disk bugs.

```
*****************************************************************
* Anyone who proposes that users hang on to their DOS software *
* when Windows version come out is just a bullshitter. In *
* addition, in a business environment, the DOS codes with all *
* their different user interfaces has caused industry $$$$$$$ *
* with training and retraining. Windows, with all of its stupid *
* problems at least presents a standard interface to the user *
*****************************************************************
```

We'll also ignore the fact that when upgrading to TOS 1.04 or TOS 2.06, much of your 1985 ST software fails to work, or works incorrectly, and surprise surprise, you were forced to then upgrade to newer versions of the software. Compatibility is even worse if you're moving up to a 68030 based machine like the Falcon or TT.

We'll also ignore the fact that some of the hottest selling software for the ST were programs like Quick ST, Turbo ST, and currently Warp 9. Gee, it seems that a lot of people weren't too satisfied with the speed of GEM's screen redraws either.

Another thing that really annoys me is how stupid an Atari ST user pretends
to be when it comes to bitching about the redraw speed of Windows. Ok,
grade 4 math. The screen resolution of the ST in color is what? 320x200
in 16 colors. 320x200*4/8 = 32000 bytes of screen memory. A PC running
Windows is typically running what, a VGA. 640x480*4/8 = 153600 bytes of
screen memory. That's almost a 5:1 increase in screen resolution, which
duh, required either 5 times longer or 5 times the processor speed to
redraw compared to your ST. If you compared oranges to oranges, you'd find
that Windows isn't that slow after all. The closest thing to VGA mode on
the ST is TT medium resolution on the TT. Actually, TT medium resolution
IS EXACTLY the same as VGA mode. Boot up a TT and compare redraw speeds of
ST monochrome mode (640x400 mono) and TT medium resolution (640x480 16 colors).
Surprise, Surprise, you'll see a major speed difference. Look at the Mac,
it has very fast redraws compared to the ST, but that's because Macs had
the smaller 512x384 screen which only require about 20K of screen memory.

****
* BULLSHIT again; the PC is just a BAD platform for graphics. That's *
* why a whole industry of hardware and software accelerators exist! *
* Boy, did you see god when MS hired you or does it have a very good *
* indoctrination program. *
****

Also, considering that a 68000 chip is roughly equivalent to a 386SX running
at the same clock speed, a 386SX is slower than a 32 Mhz 68030 in the TT
or even the 16 Mhz 68030 in the Falcon. You run a TT in one of the TT modes
and then image it running half as slow. That's what you should expect out of
a 386SX!!!! The reason you buy a 486 for running Windows is the exact same
reason you get a 68030 for running GEM - faster screen redraws.

It is not my intention to start a flame war, which is why I didn't post this
in public. But I do think your arguments for the most part are bogus. I'd
like to hear you substantiate your claims a bit more, either in private
email or by clarifying your post in comp.sys.atari.st. For as long as you're
going to go on a PC bashing bunge, use facts not fiction.

****
* No intention for a FLAME war; then why initiate a dialog based on *
* insults. I agree with other netters; crawl back in your hole. Better *
* yet, crawl up your own hole *
****

DEMONSTRATOR was a nifty little piece of software... only trouble is it will not work with TOS 1.4 and above which eliminates 80% of the market!

There is (or was) another commercially available demonstrator from Europe but I don't know who makes (made?) it. I know it was expensive, though.

:- What do you think of the A1200? I am a games player (I won't apologize for
:- it - in fact in some sort of weird way I'm proud of it) and I think the IBM
:- clone sucks as a games machine. If none ever get written for the Falcon, the
:- it too, will suck. Is the A1200 the answer to my needs?
:
: Stay away from the A1200 like the plague!!!!! Preliminary reports from
: Europe say that a lot of the software written for the A500 is trashed on
: the A1200. There are lots of compatability problems with the A1200, so
: it is not a viable machine to buy. If you don't believe me, check out
: COMP.SYS.AMIGA.* for yourself.

Hmm. When the A1000 came out, some games used the Kickstart RAM as an
additional 256K. They didn't work with the A500 and A2000, of course.

Then C= came with 1.3. Many games didn't work, because they jumped
right into the Kicktstart ROM.

When they came with the ECS, some games wouldn't work because they used
reserved bits and memory locations.

Hardly any game worked on turbo boards or the A3000.

This has been ever since. Every time something new comes out, some bogus
games crash on it. But the new games *will* work.

For instance, Dynablaster works on the A1200. You'd even want to buy an
Amiga for this game only (I don't know if it's on any other system and
if so, whether you can play with 5 players).

Since the A1200 is going to be a big hit, the newer games will work on
it. And you can still do some serious work on a 68EC020...

Peter.

Greg, I don't know about 'Fast Fix' but there are several utilities around that turn off the key click for you. My favorite fix is to turn the monitor volume down. :)

Ref the screen dump, if your printer is only dumping about 2/3 of your screen, then odds are your pixels per line setting in the Instal Printer modulue of the control panel accessory are wrong. For Epson compatible printers, the setting should be 760 pixels per line, not 1280 which is the Atari default. I think these are the right numbers but at any rate, try the lower setting and then don't forget to save the desktop.inf file.

105. Re: 8-bit/16-bit/32-bit?

Newsgroup: comp.sys.atari.st
Date: 1993-01-04 16:16:36 UTC
From: rossin@hpfcso.FC.HP.COM
Message-ID: <7340113@hpfcso.FC.HP.COM>
Source record: 212642

Believe it or not the number of bits that a processor has is not cut and dry. The 68000 is a great example of this. Internally it can support some 32-bit operations (the registers are 32-bits wide and the ALU can do some 32-bit math). However, the external bus is only 16-bits wide. Therefore, the 68000 was introduced as a 16/32-bit processor. With a 16-bit external bus, the processor has to do two memory cycles for every 32-bit operand. This also slows down code fetches of instructions that are longer that 16-bits.

My view

107. Re: MiNT and MINIX file system

Newsgroup: comp.sys.atari.st
Date: 1993-01-04 16:22:50 UTC
From: churchm@gov.on.ca
Message-ID: <1993Jan4.162250.23669@gov.on.ca>
Source record: 212645

Hi. I too, have just started experimenting with the MiNT distribution kit, and am experiencing some problems that I hope someone can help me with.

The installation requires that a Minix partition be set up. For ease, I've decided to use my D:\ partition. The installation first puts MiNT and Minix (via the file minix.xfs) on to the boot partition, and then has the user reboot. At this point, it appears it tries to initialize the floppy drive as a Minix partition. Thereafter, any time I reboot with an unprotected floppy in the A: drive, when minix.xfs is run, the floppy is corrupted. I can't tell if D: has been changed to a Minix partition or not.

So, my questions are,
1) Does anyone know of any problems with the distribution kit install?
2) Is there a special program I should be using to set up a Minix partition?
3) Is there a method of testing a partition, to see if it is Minix?
4) Is there something specific I have to do to minix.xfs, to stop it from blasting my floppy drive?

Any help anyone can give would be great.

Thanks,

Mike.

108. TOS 2.06 +$1 works in 1040ST

Newsgroup: comp.sys.atari.st
Date: 1993-01-04 16:51:33 UTC
From: rossin@hpfcso.FC.HP.COM
Message-ID: <7340114@hpfcso.FC.HP.COM>
Source record: 212646

Well, thanks to everyone who replied to me about where to shove and where to get TOS 2.06 I have gotten it to work in my 1040ST without a TEC. The solution requires 10 wires from the GLUE chip, 3 TTL devices (<$1) and 5 pins of each ROM lifted. The circuit I used is shown below:

TOS 2.06 Address Decoder and DTACK Generator:

```
(19,XX) ROM2_>-------------------------+ +--------+-----+--------+
| | Chip | +5V | Ground |
74F138 | +--------+-----+--------+
+--------------+ | | 74F138 | 16 | 8 |
(11,52) A23>---|a0(1) q0(15)|o- | | 74F08 | 14 | 7 |
(10,51) A22>---|a1(2) q1(14)|o- | | 74F06 | 14 | 7 |
(09,50) A21>---|a2(3) q2(13)|o- | 74F08 +--------+-----+--------+
| q3(12)|o- | _______
(12,06) AS_>--o|e1(4) q4(11)|o- | \ \
(08,48) A20>--o|e2(5) q5(10)|o- +--o\a(1) \
(55,09) R/W_>---|e3(6) q6(9)|o- ) y(3))o--------> CE_
| q7(7)|o---*-----o/b(2) /
+--------------+ | /______/
|
+5V |
_|_ |
330 Ohm | | |
| | |
|_| |
4 /| 3 | 2 /|1 | 74F06 (Must be open collector)
(50,10) DTACK_<-------o< |---*---< |o-+
\| \|
```

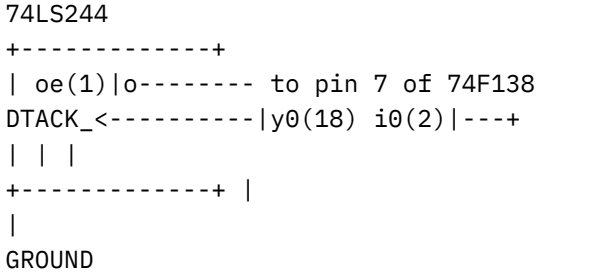
```
+5V 74F08
| ____
+--|4 \
| 6 )-------------------------->BA17
(05,45) A17>------------|5__/
```

```
+5V 74F08
| ____
+--|9 \
| 8 )-------------------------->BA16
(04,44) A16>------------|10_/
```

Note: Numbers in parenthesis on the left are (GLUE pin,68000 pin).
Parts needed are:

1 74F138
1 74F08
1 74F06

Different families (LS, ALS, AS) may be substituted for the above parts. The buffer that drives DTACK_ must be open collector or if a 7406 part can't be found a tri-state buffer can be used as long as it is used like the example below:



I have been working on a document that explains in detail how I installed TOS 2.06 (the mechanics is the main deal). When I finish it, I would like to place it in the archive but I don't know how. Could some one please tell me how to submit a text file. Also, if anyone would like a copy of the current document just send me email and I'll send you what I have.

Bye
Ted Rossin

109. Re: ST-506 HD Interface card to atari ST

Newsgroup: comp.sys.atari.st

Message-ID: <1993Jan4.170435.6138@ultb.isc.rit.edu>
Source record: 212648

I have a friend who has a harddisk with ST-506 interface and he want's to connected
it to his ATARI 520 ST. But since ATARI only sells SCSI interface cards (here in
sweden) he cannot use it with his ATARI.Now the question is has someone got a scematic of a
ST-506 interface card for AT
ARI ST
(hopefully without PAL's or ROM's)?

Interfacing an ST-506 is easy (MFM or RLL I believe), if you can, get your
hands on an Adaptec MFM/RLL to SCSI controller card. That's how they do it
with the ST-506 drives in the Megafile.

If my numbers are failing me and it's not an MFM or RLL, well, then, sorry.

Date: 1993-01-04 17:13:37 UTC
From: mrz5149@ritvax.isc.rit.edu
Message-ID: <1993Jan4.171337.6313@ultb.isc.rit.edu>
Source record: 212649

```
1 - I cannot format 720 k MFS floppies with DCFormat 3.02, for transverting
(I always get a disk error);
-------------------------------

That portion of the code in DCFormat may not work correctly with the TT.
Try formmating MFS disks in Spectre.

-------------------------------
2 - I cannot get a full A3 Mac screen - the Mac does run on a 1280x800 screen,
but it gives me 2 "squished" (and illegible) screens, side by side. In ST
-------------------------------

Unfortunately, Spectre does not support really big screens or color or any
other special features of the TT's enhanced video or Crazy Dots for that
matter! The reason for the screens has to do with the way Dave programmed it
but he may allow larger BW screens in the next version of the software.
Color support will more than likely be for the Falcon only since Dave has
to plough through the 512k Roms to get color out, although I suppose
Dave could make a 16 color version for the TT but that is unlikely since
the Falcon Spectre works of the internal bus of the Falcon (this is because
you just can't use 512k Roms off the Cart port because it only supports
128k of addressing!).

Hope that helps!

Er, you forget the fact that CompuServe and GEnie require on-line charges in order to download software as well. We're not exactly getting the ICD software for 'free' here either. Some companies, like ICD, offer on-line access to their software as a service to those people lucky enough to subscribe to that service. There is nothing illegal, immoral or attening in such offerings. Not everyone in the US is connected to CompuServe or GEnie either, and, for those who are not, it costs money to obtain updates from ICD.

On the other hand, there are plenty of European manufacturers from whom we cannot even GET an update electronically. Should we then use this as an example of how "[European] mgfrs ***** their [US] customers"? I don't think so.

Complain about something that matters.

113. Flaky mouse

Newsgroup: comp.sys.atari.st
Date: 1993-01-04 17:46:49 UTC
From: stevem@solbourne.com
Message-ID: <1i9t69INN210@katmandu.solbourne.com>
Source record: 212650
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Recently my mouse has started to act less then obedient. It will work fine for hours (or sometimes just minutes) and then , badabing badaboom, every direction is reversed, up is down, down is up, left is.... well you get the idea. The only way to fix this is to save what I'm doing and cold start it.

Could this just be my mouse or is it something inside my box?

Any help would be greatly appreciated.

Thanks.
Steve Matson.

114. ICD software source

Newsgroup: comp.sys.atari.st

A year or two ago I contacted ICD by voice and then
subsequently by modem in order to download
support software for a salvaged SCSI Mac Drive.

The people at ICD were courteous and helpful
and the new improved software worked first time.

The BBS number that they gave me was:

815 - 968 - 2229

I don't remember that there were any
unusual restrictions.

Well, to post a private letter to a public network isn't very mature IMHO. Just think about it: Would YOU want YOUR private letters posted to a newsgroup? I don't think so! You might argue that a person should be able to stand for his opinions no matter if it's a public statement or a private letter, but I really don't think many people are able to truthfully say they fill that criteria.

If you have a problem with Darek then discuss it DIRECTLY with him. To use a private letter for starting a flamewar is only going to make you look stupid infront of the rest of the usenet-world.

>
> Thanks,
> judy
>

Well, I think that below periscope depth the angle for torpedoes is taken from the current bearing. That means, that you may simply change your bearing to set it. That's very useful when you are submerged and hunted by enemy destroyers: Set the bearing to 90 degrees, perhaps, and wait until the destroyer seems to be in a good position. Of course these damned bastards like to change their course just a second before they are going to be hit :-). I've lost many,many torpedoes trying to hit one lonely destroyer. A better way is to wait until the enemies give up hunting you. Then go up to periscope depth and give them a shot into the back.

Hi Geoff,

the first line in $ADM/uucico must be:
TARIFZONEN 720 360

then you will be able to get the costs you would have to pay in *Germany*
for your poll acts... :-)

Sorry, Christian and Michael (who are friends of mine b.t.w.) saw no need to
include costs structures of foreign countries as HERMES is a german package.

Please use cicolog or cicostat which are much more flexible!

greetings Bernhard

>all company producing TV sets: "Hey, I want you to produce my 20 year old
>TV set so I can get replacement parts!". Thats nonsens, isn't it. You will
>have to buy a new one.

I'm not suggesting that EVERYTHING get packed using the -o option - just
the archives containing newer versions of LHARC.

If I'm downloading an archive containing LHARC, it's because I don't
have the latest edition, and need a newer one. 'Twould be nice to be
able to use ANY old version of LHARC to extract the new version. It's
highly annoying to have to download version J in order to extract
version K in order to extract version L.

>>- Lharc
>>There's lots of work going into maintaining/improving Lharc, but

>is all you need. [SHOUTING ON] IF ANYBODY DISCOVERS AN ARCHIVE S/HE THINKS
>IS "INCOMPATIBLE", SEND A MAIL TO ME. [SHOUTING OFF] I'll show you that this
>is not true.

Unfortunately, there seems to be separate groups of people working on versions for varying platforms.

The ATARI LHarc series may be fairly compatible from edition to edition, but is it 100% compatible with the IBM versions? It's been a while since I've done porting work back/forth, but I've always needed to keep several versions of Lharc/LHA around on both machines. One thing that is EXTREMELY annoying is the fact that a Unix port wasn't available until 1992.

>>- ARC
>>It's occasionally needed for compatibility with OLD archives.

>Hmm, how whould you define the support for subdirectories in zoo? Ever
>tried to create a zoo archive concerning a big directory tree under
>plain tos (no shell, no external programs, just zoo.ttp?) GRIN
>/s/

You're actually asking a different question. "How would you define the support required from the CLI in zoo?" Yes, for some commands, zoo requires something to go between it and the desktop. However, any time I run it from the desktop, I do it via one of the shells. Usually ZooShell. More commonly, I'm running tcsh. The only things that I DO run from the desktop are "shells" of sorts.

Well, that's pretty weird, alright, but the first step in fixing any mouse problems is to take it apart and clean the sucker. Make sure you get all the goop off the rollers when you do. It couldn't hoit. :)

Barring this, there was a little semi-comedic virus running around a few years back that caused erratic mouse action such as you describe.

Hey Geoffrey!

This is an old hack written by me ;-)

The fact is that it works only in the german phone area because it
needs certain costs for one unit (time-interval), i.e. each unit
costs here 0.23 DM and has a certain length which differs depending
the actual time.

With the line 'TARIFZONEN: x y' you set set length of these time intervals
for two different day times.

But there was never a question from U.S. for patching the prog for U.S. use
too.

Sorry,
Michael

[lots of stuff deleted...]

My goodness. I have read plenty of messages from Darek that made me lose respect for him. This, however, is _not_ one of them. All of what Darek said seemed level-headed and well documented, down to the calculations of bytes transferred in screen redraws. Most of csullogg's responses were infantile and often incorrect. I think he disgraced himself (and not Darek) in this post.

By the way, the slowness of Pagestream redraws is due to poor algorithms and/or coding, not the speed of the ST. DTP programs for the mac redraw quite satisfactorily under Spectre GCR on a stock ST. Take a look at Calamus if you'd like to see the result of good redraw algorithms. If pagestream is depressing you, don't upgrade your machine, pressure SoftLogik to upgrade the program to make it usable.

GC>contains a small graphite block which makes the contact on the PCB.

Well - I don't think you are actually *missing* one, as I think it was
not there in the first place :-)

There usually is space for two of those rubber parts under the RETURN
key, but there is only one mounted there - so if you place two of them
under the RETURN key, you miss one elsewhere :-)

btw: if you have disassembled the whole keyboard, it might be a good idea
to clean the gold contacts and the inner part of the rubber parts (with
the small, round piece of conductive rubber) with a cotton-wool-tip and
some ethanol or isopropanol alcohol (use at least 95% pure alcohol, and
no aceton or other sharper solvents) - you get a much better keyboard
reaction, just as if it was new :-)

While I'll admit to not having used PC VGA much, I do know about the speed
of TT medium. Its not slow. I'd say that it's speed is better than
ST medium (even faster with Warp 9). Actually, the speed is better than all
of the ST resolutions on an ST, though ST high is a close call.

130. chkdsk

Newsgroup: comp.sys.atari.st
Date: 1993-01-05 01:26:16 UTC
From: jmw@tasman.cc.utas.edu.au
Message-ID: <jmw.726197176@tasman>
Source record: 212726

Whenever the discussion comes round to defragmenting hard disks and otherwise maintaining these cantankerous beasties, inevitably chkdsk from Atari is recommended. However as I understand it, it is only available to registered developers. If that is not so, can anyone tell me where I can get it?
If it is true, perhaps Atari could be persuaded, in the interests of public relations, to make it more freely available to the rest of us who occasionally have disk problems too.

Thanks,

Ah ha!!! It sounds like you have a boot sector virus. I forget the name of it, but if it is what I think it is... it is a typical boot sector virus that is probably jumping around in your floppies. this virus has a counter and waits until it has made 5 copies of itself before it starts randomly reversing the direction of the mouse pointer.

My friend gave this virus to me once, but he discovered it earlier since it had a chance to make 5 copies on his system before mine. He informed me, and I just used a simple virus utility like Virus Kill to clean up my discs.

We've been very lucky here in Atariland that it is relatively difficult to become infected. With few of us around and not many people going through the trouble, I guess we haven't gotten around to selling big virus killing software like our cousins...

Source record: 212727
Cross-posted to: houston.forsale,misc.forsale,misc.forsale.computers.other,comp.sys.apple2,comp.sys.atari.st

Greets, all!

I have some worn, but loved, equipment for sale.

- Franklin Ace 1000, the Apple][clone.
Has two disk drives, parallel card, and a
pretty good Amdek Color monitor (that makes
a good VCR monitor, too!) Nice starter system for
kiddos, good for an extra disk duplicator, why not
get started with home robotics? :-) Many disks...

$195 or best offer...

- Original AppleCat modem, with extra 212 card, docs,
and lots of nifty software that turns it into an
answering machine, a music synth, or even a modem! :-)
Own a bit of Apple][history!

$95 or best offer...

- Atari ST VideoKey (mint condition), provides much better
video output for desktop video work. With warranty card.

$45 or best offer...

- Atari 600XL, without power supply or TV modulator. Do you
have lots of 8bit stuff and want more?

$10 or best offer...

- Vic-20, without power suppler or TV modulator. Hack with the
masters, or maybe not. It has a new C64-keyboard in it, easily
worth the price.

$10 or best offer...

- Total Security System TSS-2000 alarm gizmo box thingy. Sensitive
to motion and noise, it flashes a strobe, makes godawful noise,
and gives power to the plugs in the back...perhaps useful for
playing tapes of dogs barking, gunshots, police sirens, in-laws?
Crufty, but it works.

$20 or best offer...

- Lots and lots of sci-fi books. $1 each.

WANTED: MIDI keyboards, weird CDs, oldies software, dusty Powergloves,
computer animation or anime video tapes (Bubblegum Crisis favored),

lengths of fiber optic cable, laser tubes & power supplies,
C, UNIX, and Postscript books, XT motherboards etc, long range
walkie-talkies, reverb assortments, Infocom games and game junk,
Ultima IV ankh (!), packet radio equipment...open to offers.

Thanks!

>your crap.

Really, Derek's been going pretty light on the bitching lately. Now
you'll just get him going again (and rightly so).

Daniel has done a lot for this group, and I hardly see his defense of
Darek here as some kind of sell-out. Daniel would do us all a favor to
ignore your request that he take a hike.

Darek has a PC. He works for Microsoft. He writes PC software about
16 hours a day, I'd imagine. None of these things, however, changes the
fact that he's written some of the best-selling ST software ever made.
I think it's safe to say that he knows what he's talking about when it
comes to technical matters regarding both the ST and the PC, despite
his obvious bias towards PC (against ST's?).

>BTW, I'll gladly repost anyone's private mail if they attack me for
>my net comments. Take that as a warning if you want to send me a nasty
>note!!!

With this is mind, I'll save you the trouble by responding publicly.
Darek has posted some inciteful stuff in the past, but the message you
quoted from -- even if it had been public, which it wasn't -- was
hardly flame bait. Contentious, yes. Out of order? No. (IMHO)

Posting private email, BTW, is arguably illegal in many countries,
since the paper analogue -- publishing a private letter from someone
in a magazine, newspaper, etc. without their permission -- is illegal.

We went through this a few years ago. You could ask in misc.legal for
a more definitive answer, but at the very least posting private email
is seriously frowned upon.

>crawl back in your hole. Better yet, crawl up your own hole

Ah yes.. you certainly convinced me, Greg.. makes me proud to be an
Atari owner, just to hear you talk.

What makes it even more amusing, although pitifully so, is that you're
so wrong about most of what you seem to be defending so obscenely.

Makes me glad I decided to ignore that little bit of flamebait you
posted not long ago.. it would probably be me you were calling names,
instead of Darek...

Come to think of it, you'll probably call me names anyway..

Well, nyah, nyah to you too..

(See, I can argue just like an Atari Cheerleader too..!)

Don't you really HATE it when PEOPLE use capitals to (I assume?) enforce a POINT? It makes you wonder whether they speak like that as well, almost shouting occasional words, visually its very irritating as well, because I find that reading words written in capitals is, in an esoteric kind of fashion, somewhat harder to absorb.

Anyway, I wouldn't say that the 1040STFM is an old, outdated machine, at least not yet anyway.

>parallel port instead?

A better way would be to use a MAC SCSI-ethernet board with an
ICD ACSI-SCSI connector. This would be faster, but the same
problem with lack of software drivers exists. Now if you
could get software only from the German companies at a reasonable
price...

>service. There is nothing illegal, immoral or attening in such offerings.

No, of course not, I merely wanted to point out that ICD offers a service to
their US customers while not offering a similar service to overseas customers.
If I appear to be bashing ICD here, I'm sorry. It's just that I observe this
behavior from US companies *all* the time. If you want examples, send email.

> Not
>everyone in the US is connected to CompuServe or GEnie either, and, for those
>who are not, it costs money to obtain updates from ICD.

Indeed. The *real* problem is that ICD is a little paranoid about people
tinkering with their software. I had a discussion with Tom Harker on CeBIT
about this *ages* ago, and we agreed to disagree :-(

>On the other hand, there are plenty of European manufacturers from whom we
>cannot even GET an update electronically. Should we then use this as an
>example of how "[European] mgfrs ***** their [US] customers"? I don't think
>so.

If they offer electronic updates for Europeans but not for US customers, you
should at least let them know that you're unhappy. I am unhappy with ICD,
and precicely because their s/w is *good* and I can't get an update the way
US customers can.

>Complain about something that matters.

Right you are. Should I cc Darek M. and Bob R. ?? :-)

j>I ran across an application called 1st Card about a year ago.
j>It was similar to Hyperlink, allowing data and graphics to be
j>used in a database construction. I would be interested in
j>hearing from anyone who has had experience in using it, or
j>cross references between it and Hyperlink.
j>
j>It is also supposed to support an expert shell, which would
j>be very beneficial to the type of application I plan to write.
j>This program evidently won an award for the most innovative
j>new educational software in Aug. 1991, so it seems there should
j>be some facts about it soomewhere, and perhaps a demo??

1st Card is distributed in the US by

ZEPHYR
MICROWORD
Bill Yerger
1525 University Ave
Berkeley
CA 94703

PH (510) 845-2000
FAX (510) 548-2119

It comes with a manual (english, 120 p.) and several demo applications.

The company who sells it in Germany (I'm the programmer) is:

LogiLex
Eifelstr. 32
D-W-5300 Bonn 1
Germany

Tel.: +49-228-658346 (7:00 to 12:00 Middle European Time)
here you can reach me
Fax.: +49-228-655548

I'm sorry, there is no international demo-version of 1st Card. But a german demo-version is availlable (with english manual). This demo is more than 2 years old and does not have the features for sound and several other new functions. The Full-Text-Data-Base-Modul has speeded up to find now words in i.e. the whole bibel within 1/10 sec. But the speed was very fast also in earlier versions.

The demo-version is only limited in the size of the applications (stacks).

If you want to have more infos or an PD-Application, please write me.

Atari 1040 ST for sale, with Atari SC1224 color monitor and lots of
software:

- Utilities, etc
- Dr.T's Midi Recording Studio
- Mark Williams C V3 with CSD source level debugger
- Magic Sac cartridge with 64K ROMs (MAC emulator, w/system, finder)
- Degas Elite (graphic arts)
- NeoDesk (alternate to GEM desktop)
- G+Plus (GDOS enhancement)
- ST Doctor
- Tempus text editor
- Easy Draw/Easy tools

- Business, Word processing, etc
- Publishing Partner
- Phasar (accounting system)
- LDW Power Spreadsheet
- WordPerfect 4.1 for Atari ST
- PageStream V1.8 (WYSIWIG Desktop Publishing)
- Superbase (relational database system)
- Microsoft Write
- Swiftcalc ST (spreadsheet)

- Games
- Flight Simulator II
- Star Wars
- Wanderer (3D)
- Ballistix
- Monkey Business
- Space Station Oblivion
- World Karate Championship
- Chess (Psion)
- Time Bandit
- Deep Space
- Kinderama (early learning games)
- Disney's Winnie the Pooh

- As well as PD disks of games/utilities, ST Internals and GEM programming
docs.

. Asking $450 for the package. Will consider splitting.

147. ST Upgrading

Newsgroup: comp.sys.atari.st
Date: 1993-01-05 14:33:18 UTC
From: csullogg@cc4.crl.aecl.ca
Message-ID: <5JAN93.09331877@cc4.crl.aecl.ca>
Source record: 212738

Question: Why did Windows only become popular recently?
Answer: Until recently, no PC was fast enough to run it effectively.

Question: Can a person with little or no computer knowledge set up
his/her own PC?
Answer: Not likely.

Question: If you use DOS based software, how many user interfaces
do you have to learn?
Answer: One for each program.

Question: Can an XT or AT owner expect to make much use of software
released in 1993?
Answer: Yes, if he/she needs door stops.

Question: What company has built an empire based on upgrades (even
when those upgrades provided minimal improvement)?
Answer: Microsoft.

Question: Who gave the world DOS?
Answer: Microsoft (That's reason enough to hate Microsoft)

Question: Who gave the world Edlin?
Answer: Microsoft (a second reason to hate Microsoft)

Question: If any other company besides IBM had marketed the XT, would
it have survived?
Answer: Not likely.

Question: What computer was outdated when it was released?
Answer: Anything with a 386SX processor.

I am sure that someone who hates Atari, Apple, Commodore, etc can
come up with a similar list of questions. The point is, everyone
can criticize the other system. The point of MY posting about PCs
was that I get to use them almost every day (XT right on up to a
40MHz 486) and I still prefer to use my Mega or my TT. No amount
of bitching from Darek is going to change that.

My statement that it has been cheaper to upgrade STs by replacing
them IS true. When I bought a 520 for $1200 in 1985, a 640K PC
with dual floppies cost over $5000. When I went to a Mega with a
20 meg HD I paid $3000. It was still over $5000 for an XT with
a hard disk (I sold my 520 for $500). Software for the ST cost
in the range of $50 - $125 when PC applications were $150 - $500
for similar programs. Altogether, I have invested (all hardware
and software) about $8000 in Atari hardware and software (I

now have a Mega4, a dual 50-170 meg HD, an SLM605 laser, a REFLEX card (1024x496 on an SM124 monitor), a 21 meg floptical, and my software (Pagestream, Calamus SL, LDW, ...). If I had gone with the XT plus HD it is UNLIKELY that I would have swapped boards to go to an AT (several years ago there were many fewer clone manufacturers and very limited support; it's not the same today) I would have invested about another $2000-$3000 and would have had to abandon that for a 386 or 486 in order to run Windows based software. So, ignore the hype from pro-PC users. Overall the cost of swapping STs has been cheaper than upgrading PCs and software and I still use a computer bought in 1987 to run software written in 1992 and will run software written in 1993 quite nicely. Can the same be said for a 1987 vintage PC running software in 92 or 93?

The following are quotations for computers based on a request for quotations I issued in Septermber 1984. You be the judge as to whether or not a PC was a good choice.

CPU Tandy 2000 HP150 Mac
128K RAM 256K RAM 128K RAM
one floppy two flop one floppy
$3800 $5054 $4830

DOS -- $361 $220 (Apple Opsys)
128K RAM $359 --- not avail
mouse touch included
& board $285 screen
monitor $349 included included
video
card $600 included included
2nd
floppy included included $790

The next time someone describes the quick replacement of boards and components for a PC, just remember that the person is describing TODAY's market; not the market of '84 and '85 when there were very few suppliers (IBM failed to quote on the above request because it did not have a user friendly front end as required by the quote request. The HP150 touch screen was purchased because the Mac had virtually no software. The touch screen was used for four years to enter data to a CYBER database).

Again, I stand by my statement that overal it was FAR cheaper to turn over STs than PCs as the computing world matured. It was even a better deal considering that I resold some early acquisitions to offset the cost of upgrades.

148. Question : ___ M-ROS ___

Newsgroup: comp.sys.atari.st

I intentionally was abusive to Darek to show him what it was like to receive an abusive post. Hey netters, I have been posting on this net longer than most of you and I have provided tons of info and guidance to many, many netters. I make no apology for my posting about Darek. It was intentional and I would do it again. No apologies.

As for Darek being level headed and right, that's a crock. Read my previous post describing how I am right in my assessment of upgrading an Atari vs a PC. Darek is making his comments in light of today's environment; not with the historical picture in mind.

Why do you think he was an Atari enthusiast at one time? Could it be the Atari had a user freindly operating system and a great price when the alternative was an XT with DOS 2? Darek is way off base in his arguments because it focuses on today's market. Remember, I was referring to the last 7 years of the market place.

Is this the bug about setting echo to refuse??? I tried setting that and
it still died. I found that if I had mint installed I could start a
telnet connection without my machine bombing, but I never get a login:
prompt from the machine I am telnetting to. I type a CTRL-T and the
machine I am trying to connect to responds with i am here...

I have just about given up...

> I think this is an Atari virus.
>
>

You're right, it is an Atari Virus.
Boot with CLEAN disks and using a disk utility, check the header
on the disk. (track 00, sector 00, side 0)
If it isn't 00, then it has a jump instruction (60 I think).
This means the disk runs something before going to the AUTO folder
(or whatever).
CAUTION: some commercial disks have this jump intruction.
DON'T mess with it if you don't know what you're doing.

If it has data, change the jump instruction to 00 00.
This will stop the disk from running the virus.
You can now safely remove your data and format the little bugger.
Make sure you check your disks for it - it may have spread.
Best thing is to use a virus killer as this will recognise a virus
from a commercial disk.

Best of luck.

Antony,

153. Spectre & TT

I am owner of an Atari Mega ST and Spectre Version 3.0. I intend to buy a TT with a large black and white screen. I have the following questions:

1. Does Spectre support the large screen in its full resolution?
2. Is the internal SCSI disk accesssible by the Mac?
3. Does anybody have a similar configuration who can report me about his or her experience and problems?

Thank you

Juergen

154. HP550C Printer Drivers

Newsgroup: comp.sys.atari.st
Date: 1993-01-05 16:51:00 UTC
From: jsa@rcinet
Message-ID: <5JAN199311512496@rcinet>
Source record: 212743

OK, I broke down and bought the new HP550C color/black ink-jet printer. This is an excellent printer for the price. So far, I have been trying print utilities, searching for the one that I won't be able to live without. The most impressive seems to be Greg Wageman's PRINTALL utility, but that was only written with drivers for the HP500/HP500C. What I'm trying to get at is the difference in the abilities of the 500C and the 550C. The 550C can print from the black ink cartridge and the color ink cartridge at the same time. (The 500C could only use one cartridge at a time). Thus, the 550C color printouts need not have the pseudo-black patches where real black ought to be. Also, better dark shades could be made by mixing a real black and Red/Blue/Yellow, as needed. In the clone world, drivers are already available to do this. Is someone out there knowledgable enough to come up with such a driver for atari users? Short of that, does anyone know Greg Wageman that might see if he could be persuaded to indulge in such a project? I think I saw where he had done something for Oki printers, so he may not have done the 500C stuff just because it was what he personally was using. Who knows... Since I am probably not the only person with an atari and a 550C, it would be nice to see postings here about any 550C specific atari drivers that come into existence (or already exist). Thanks.

>my previous post describing how I am right in my assessment
>of upgrading an Atari vs a PC. Darek is making his comments in
>light of today's environment; not with the historical picture
>in mind.

You are right there, Darek is not level headed when it comes to Atari.

He HATES Atari. I once spoke with him at an Atari show and the only
reason he was there was to convert Atari users to clones.

He still believes that Atari will go bankrupt, but I think according
to Darek, they should have been gone by now.

One cannot be level headed when you let your feelings get mixed in.

I don't believe Atari should piss of anyone, but obviously, they pissed
off two developers enough to join the clone world.

A mistake.

>
>Why do you think he was an Atari enthusiast at one time? Could

Could it be that Darek had HIGH hopes for Atari Corporation.

He may have REALLY believed that the company could become great.
He probably had higher hopes for Atari's products.

And to hate a company as much as he does, he must have loved something
about Atari to begin with.

>In article <2648@eagle.ukc.ac.uk>, wabe@ukc.ac.uk (W.A.B.Evans) writes:
>>e.g. FSCK by Georg Lohse and DLII and REORG by Simon Poole, and more recently
>>CLEANUP by ICD and some tools I developed myself.
>
>Never ever use these prpgrams to fix hard disk problems,(FSCK-DLII/REORG) they
>have more bugs that Bugs have..
>
I HAVE been using these quite satisfactorily for my old SH-205
(20 Mbyte) Atari Hard Disk. These programs were developed round about the
time that (SH-205) hard disk was the current (Atari) model and have NOT been
upgraded to keep up with developments in later TOS'es and Hard Disks. I
certainly would not use these on my recent ICD hard drive.

Hence it is no wonder that you might find them "buggy" if you have a
recent hard disk - but it is unfair to the original authors to call these
"incompatibilities with more recent software/hardware" bugs. Mind you, having
made this point, I'm sure these (like most others) do have a few bugs but
these are NOT so frequently encountered as to render these programs unduly
dangerous or ineffective when used with the "earlier" drives for which they
were designed.

>CleanUp it nothing like KnifeST and I found that it failed with a hard disk
>problem, that Ataries CHKDSK3 showed up, cross link clusters..???
>
Both are disk repair utilities - though I agree they're not quite the
same. CLEANUP, though hardly perfect, is, in my opinion, far more up-to-date
than KnifeST ver 1.10. By the way, where can one get this CHKDSK3 program
that more than one of you rave about?
>
>BGM Partitions, I think Atari took to long in bringing out a standard,
>is it one,? and most other hard drive firms ended up developing there own..
>
As I understand things, BGM Partitions are Partitions where the
logical sector size is other than 512 bytes (usually 1024, 2048 or 4096
bytes). This allows you to have partitions of much greater size than 16 Mbytes
(or 32 Mbytes on TOS 1.4 and above). I first met the term in my ICD manual
when I obtained my hard disk. Since you appear to have ICD's CLEANUP, I'm
surprised you are not familiar with the term. Provided programs "look up"
the logical sector size from the Bios Parameter Block, i.e. NOT assume it
is 512, they should handle BGM Partitions quite satisfactorily. I'm sorry
to say that, despite a claim by Hisoft to have corrected errors in dealing
with Partitions of greater logical sector size than 512, I got erroneous
statistics when I used KnifeST (1.10) to query my BGM partition (F:\) where
the logical sector size was 1048 and size about 40 Mbytes though the same

option worked fine on the other (non BGM) partitions.
>
>Does any one support BGM Partitions..??
>
Yes, ICD for one.

>the bug.
>
>I have had sucesses with this (I'm not the only one to get it to
>work :-)
>
>Simon.

Simon:

I'm pretty sure I'm not running TOS 1.0; the machine is a MEGA STE, with
4 meg of RAM, and a 50 meg hard drive partitioned into C: and D:, and
is only a year old. I'll verify it when I'm back near the machine.

In the meantime, this is what I did.

Un-ZOO'd DISK1.ZOO to a floppy, and used it as the install disk. On
that disk was a program called SETUP, and a program called INSTALL. I
ran SETUP, using D: as the root, and A: as the install drive. I saved
the configuration. SETUP renamed my ACC's and my \AUTO*.PRG's, and
then moved MINT.PRG to the AUTO folder, and moved MINIX.XFS, and
MINT.CNF, and three other CNX'x to the MINT folder. SETUP then
requested me to RESET (Reboot?).

Rebooted the computer. MINT runs. MINIX runs. When MINIX runs, and I
get the MINIX initial message, the floppy drive light comes on. When
the system finishes booting, the floppy disk is no longer readable. In
fact, accessing the floppy drive hangs the system. This is where I
believe that the floppy has been turned into a MINIX partition. If I
write-protect the floppy, it remains readable, but the light still comes
on when MINIX runs. It doesn't appear that anything has been done to
D:. I believe it is still a TOS partition.

Any of this look wrong?

Regards,

Mike.

Don't give up on the telnet feature just yet! The latest sources at the
UK site that was posted before fix the telnet bug (I can verify this). The
binaries have not yet been released there. However, I compiled the binaries
```

from those sources myself with GCC 2.3 a couple weeks ago, and have had no problems with the telnet to all the sites that used to make it bomb on me before.
I wrote to the person who did the port for the source, and apparently he is more active on the local UK nets than here on Usenet (from the sounds of it) since the source is available, I don't think there would be a problem with me uploaded to a.archive the binary that I compiled with that source?
I'll only upload the net.ttp binary (archived of course) since the entire rest of the package, including the docs, have remained the same.

>1. Does Spectre support the large screen in its full resolution?

Not currently. Remember the Spectre GCR emulates a Mac Plus. Rumor is that Dave Small will incorporate support for TT's with large screens in the next release, which is long overdue, BTW. Even so, with the TT you'll have one speedy Mac Plus!

>2. Is the internal SCSI disk accesssible by the Mac?

Yes. You just have to set up separate partitions for Atari and Mac use.

>3. Does anybody have a similar configuration who can report me about his or
> her experience and problems?

I'll leave this to others who may have a TT and GCR. But one problem you may first encounter is the inability of the TT's internal drive to read/write in Mac 800K format (the GCR does not support 1.44Mb... yet). The easiest fix is to pick up an external DSDD SF314 for your floppy drive B and use it with your Mac floppies. That's what I did when the GCR wouldn't work with my MSTE's internal floppy.

========
NOTE: 6.0.8 is 6.0.7 with System 7 compatible LaserWriter drivers.

I've run 6.0.8 without a hitch under Spectre.

Info source: MacEKG doc notes.
6.0.8 actually reports 6.0.7 to MacEKG for the above reason.

A good way to turn the key click off is to use ATARI's XCONTROL.ACC. It
also can set up the hardcopy-routine to fit to normal Epson printers. There
are a lot of people saying XCONTROL only works on TOS 2.x and above.
I used it on an old 1040 with TOS 1.2 and 1.4 for a long time without problems.

165. Kermit file transfers at 9600 bps

Newsgroup: comp.sys.atari.st
Date: 1993-01-05 21:46:52 UTC
From: cordes@ac.dal.ca
Message-ID: <1993Jan5.174652.9895@ac.dal.ca>
Source record: 212655

I'm having some problems downloading from a Vax using Kermit with my new 9600 modem. There doesn't seem to be any way to coax the transfer (I've only been trying a binary file) to take place at speeds greater than around 230 cps or so, despite the fact that the connection is at 9600 baud and the HS light on the modem remains on. I've tried both the Kermit in Uniterm, and an old Kermit Desk Accessory.

When I use zmodem for the transfer, the rate goes up, but there are many errors. I'm told that this is because our mainframe connections are not yet supporting hardware flow control, so XON/XOFF has to be used. The effective transfer rate seems to be usually around 480 cps (i.e. around 50% efficiency).

Would anyone by any chance have any ideas what else I might do? Thanks.

John

>reason he was there was to convert Atari users to clones.

I think I can shed some light on why Darek hates Atari so much.

A couple of months ago, after some angry posts here from Darek, I asked what Atari had done to him. In an e-mail reply (which I will NOT post :-)), he explained that the problem dated back to the days when he was working in the XFORMER 8-bit emulator. Atari refused to let him sell it with the BIOS chips (I believe he said they wouldn't sell the chips to him in the first place). Darek was less than pleased with this action, and thus began his personal vendetta against Atari Corp.

While I think that Darek has over-reacted a bit to this action by Atari, (Dave Small's relations with Apple seem much better Darek and Atari's) I accept the fact that he feels that Atari did him wrong, and nothing any of us say is going to change that.

Mr. Mihocka, it is understandable that you are upset about the current Windows situation. I have asked you a long time ago about GEMulator and its ability running under the superb OS/2 2.0 environment. You have provided me with a 4 page message crying why IBM sells OS/2 and their poor ability to test it. This statement is rather very funny and showed me the Fear, Uncertainty, and Doubt about Microsoft's ability to produce a good product. So here we go again, did you test GEMulator under OS/2 2.0. Since GEMulator is a DOS product, and OS/2 is better DOS than DOS, I would hope that you did verify GEMulators ability to work with IBM's OS/2.

OS/2's success is tremendous and is growing remendously. Wouldn't it be obvious to make it work with GEMulator and test it under the OS/2 environment?

Best Regards,
Mark K.

168. Pagestream printing (Was: Good old me)

>--
>William Magro NeXTMail welcome
>wmagro@uiuc.edu

I'm not sure if you were just talking about screen redraws or printing
as well. Calamus is tons faster at printing than Pagestream, even to the
same printer. What the problem turns out to be is that Pagestream's
printer driver calls TOS to print, i.e. it calls Bconout to print each
and every character to the printer. That's fine, except that as every
Quick ST / Warp 9 user knows, the Bconout and other trap handlers in TOS
are extremely slow. While Pagestream is printing it spends about 90% of
its time in the Bconout handler! Someone should call the Codeheads to
add some code to Warp 9 to speed up the handling of Bconout to the printer
(since it already speeds up Bconout to the screen). I would guess that a
similar hack to Warp 9 could significantly speed up Pagestream printing,
limited only by the baud rate of the parallel port.

Calamus's printer driver on the other hand already writes directly to the
hardware so I suspect there's little that can be done to speed up its
already fast printing.

Well, I was willing to let that one go, since it seemed to have been
elaborated on sufficiently, already.

For the gory details, let's look at Mac history. The original Mac, released
in 1984, came with 64K ROM and 128K RAM. This configuration was too tiny for
the compiler to run in, and as a result, all Mac software development had to
be cross-compiled from Lisas. To upgrade this system, you could get some 3rd
party gear (Levco and Hyperdrive spring to mind) and butcher the boards to
cram in 512K and a 10 or 20 meg hard drive. A year or so later Apple repented
their erring ways and released the Fat Mac, which also came with a whopping
512K of RAM, but still the same old 8-1/2" 512x342 screen. Ok, so later we see
the Mac Plus, with an astounding 1MB of RAM, and a 128K ROM. You could upgrade
your Fat Macs to Mac Plus's by, guess what, ripping out the motherboard and
sending it back to Apple to get a new one. Same story again when the SE was
introduced, etc. etc.

At least with the ST, you had a usable memory configuration from the start
(512K and 1MB in '85) and space on the board to upgrade to a full 4 MB,
without *requiring* you to jury-rig the RAM... And a real DMA bus for adding
a hard drive, instead of soldering a hard drive interface onto the CPU pins...
I dunno about the Amiga, but anyone who claims that Macs are genuinely
upgradable is either a moron or has been brainwashed by the idiotic Apple
propaganda.

The point being - we've already rehashed time and time again how "upgradeable"
PCs are. But to claim that Macs are upgradable *is* just pure BS, in my book.

You throw away the motherboard and buy a new one. There's no *computer* left in that case when the motherboard is pulled out, just a bunch of inert plastic and a wimpy power supply that overheated and burned out in 40% of the production runs.

A year ago or so I had some email contact with folks at the TU
Wien (Vienna), who had written a TCP/IP package for the Riebl
Card plus. They had their stuff posted to an ftp site called
fortec.tuwien.ac.at (if I remember that correctly). I don't know
if they posted the source code too, but if so, that will
certainly be useable for writing said software drivers, I figure.
If they didn't post the source, there may still be a fairly good
chance they're willing to share it, since this took place at a
university.

I beleive the ST does not have all the necessary lines connected to
the parallel port to make this work. This is the reason that was given
for the lack of a ST <-> Portfolio parallel port link for the when it came
out.

Regarding the lower transfer rates:

If the modem is a MNP5 modem, and you are going in through a packet
switch to get to the VAX, be sure to turn off the MNP5 compression. With it
on, it really causes delays (similiar to your figures) when transmitting or
receiving data or files. To make sure, try the command: AT%C0 to you modem
to turn it off. Also, when sending via Zmodem with the 'sz' command
in many instances you will need to add the -e switch to escape all control
characters.
SO: 1) before dialing the modem: AT%C0
2) use : sz -e filename when sending a file

Also, for receiving a file to your ST from the vax, be sure you Zmodem
is set to receive 'escaped control chars'.

One final note on Zmodem vs kermit, is your data connection to the vax
a 7-e or 8-n connection? If it is 7-e , you most likely will have to stick
with kermit.

Hope this helps.

Two boxes for sale (hopefully together!) :-)

Grid 1810 Laptop
NEC V20 processor, 10Mhz
1 Meg RAM
20 Meg internal (removable cartridge) hard drive
EGA 640x400 monochrome LCD screen
internal 2400-baud Hayes-compatible modem
DOS v3.3 in ROM.

A good little beastie; bought it last spring, and have used
it as a terminal to connect to *nix workstations at school.

Atari 520ST
68000 processor
1 Meg RAM
1 STM1 mouse
2 SF354 SSDD 3.5" floppy drives
1 SM124 640x400 monochrome monitor
+ misc Atari manuals

Used to be main iron at home... got replaced with a Mac, then
Grid. Time to clean out the cupboards, and save up for a
Unix box :-)

Prices -- $350 for Grid (alone)
$150 for Atari (alone)
$425 takes both ...

Please contact me via email if you're interested. I'd really like to
sell *both* of these, so ...

Lou.

Source record: 212672

Howard Chu asked about the problems I've encountered using his version of the KA9Q software.

The only real problem I've run into is that if I forget and try to run it with a RAMdisk in memory, it will immediately return back to the desktop.. no bombs.

I'm using the Micro-Time "RAMBUFFER" combination print buffer and RAMdisk, usually with a 900K RAMdisk installed in my 2.5 Meg ST, so it shouldn't be an out of memory problem.

As long as I reboot before running KA9Q, it runs great.. (I do wish there was some way to make it hang up the modem before exiting though... :)

>While I think that Darek has over-reacted a bit to this action by Atari,
>(Dave Small's relations with Apple seem much better Darek and Atari's)

This is all very true, but the actual events go even deeper than
that. I remember calling a BBS in Kitchner, Ontario so I could
get the latest versions of the "Apple II/Atari 800" emulator
for GEnie. I thought it was a *great* idea.. the perfect
"bridge" that Atari 800 owners needed to make moving to the
ST platform the logical step. The ST was TOTALLY incompatible
with the 8-bit Atari.. you couldn't even reformat your floppy
disks and reuse them. An 8-bit owner had NO reason to blindly
buy an ST.. and a lot of them did take the opportunity to look
around at what else was available. A lot of them ended up going
with the Amiga, since it was the logical successor to the
8-bit Atari.

An emulator which would let them use all their old software, and
would even allow them eventually to use their 8-bit disk drives
on a shiny new ST would be just perfect for Atari to support.

In typical Atari fashion however, they came out with both barrels
blazing, shooting themselves in both feet at the same time.

They couldn't get used to the idea that a teenage kid from
Kitchner, Ontario could not only envision something like this,
but actually make it work.

Atari's master of "Public Relations", Neil Harris, publically
called Darek a "little twerp" and said Atari would never deal
with him.

So, not because of technical problems, but simply because of
their egos, Atari lost the chance to offer this bridge to their
new computer. Darek went on in spite of them and made the
emulator work.

Nice way to begin a career supporting a particular computer, eh?

(Incidentally, not all that many people know this either, but Atari originally laughed at Dave Small, saying 'who would ever want to emulate a Macintosh on their ST?' Stupid idea, wasn't it... imagine where we'd be today if Dave Small hadn't gone on independently, again, in spite of Atari.)

As I mentioned before, you have NO idea what it's like trying to deal with Atari Corp. until YOU have experienced it.

Yup.

OS/2> It comes from experience. I've played with a LOT of different machines
OS/2> in my day. (Happens that I sell computers for a living...) From VIC 20
OS/2> to 64 to AMiga, from 400 to 800 to XE to ST and TT, from Mac at several
OS/2> levels and from XT to current dinosaur. ANd it's a simple choice for
OS/2> me: I get the most productivity in the least time with my ST. And facts
OS/2> are facts. You go ahead and buy your $899 '486 with monitor.

You must be joking. Any 486 running a modern OS (not DOS) will blow
the socks off an ST. I paid $49 for OS/2 and it does things on my
"dinosaur" that are simply impossible on an ST. I can honestly say
that if I still had my ST it would probably spend 99% of its time
as a terminal (Uniterm is still the best damn terminal emulator around)
attached to one of the many free serial ports on my 486. I can run
all of my DOS/Windows and OS/2 software (simultaneously) and if I reboot,
I can run unix and X windows. Also, there is simply no comparison when
you look at the available software library. There are thousands of
professional developers producing quality software, not to mention
many quality shareware and freeware programs for the Intel-based
boxes and this is growing rapidly. Compare that to the ever-shrinking
handful of people that are willing to roll the dice with Atari. Your
software options are SHRINKING, not growing and this will get to be
more of an acute problem as more developers and users jump ship.

OS/2> WOn't
OS/2> offend me any at all if you find yourself headed for a service station
OS/2> in the VERY NEAR FUTURE. When you buy cheap, you get cheap. Simple as
OS/2> that.

This is coming from someone who bought an Atari computer??? Hehe, this
is great .signature material folks!

I wouldn't recommend it. It is incomplete, and buggy. Better get the
Sozobon compiler if you don't have enough memory gor GCC. It is free.

I second this - I thought I had read that it _did_ work on a large monitor, but I have not found
a way to do this. If anything comes up, I'll let you know!

> >2. Is the internal SCSI disk accesssible by the Mac?
>
> Yes. You just have to set up separate partitions for Atari and Mac use.

******* I disagree ! **********
A very important point - for me, it is _not_ possible to use
any internal drive with TT and Spectre; Dave Small also states this in the manual. If John
can tell me how to do this, I would be very happy, but I think not!
I am running Spectre off an external drive, an Atari 60 Mb connected through the laser, and configured as ACSI 0. Incidentally, at the moment (I have had the beast three days) I am
UNABLE to transvert to or from this disk, which irritates the hell out of me.

That's good to know! I wondered what was happening with my floppies. Is there really no way to use Mac floppies? Damn.

QUESTION: How can I transvert Atari -> Mac? The floppy doesn't work, the internal SCSI doesn't work, Transverter refuses to recognize the (functional) MAC partitions on my external ACSI, ... I think I feel an email to Dave Small coming on ..

I think your problem is that older versions of the built-into-ROM Desktop
convert all letters of the parameter string into upper case, which zoo
does not like: A option "X" is very different from option "x" for zoo.

Get yourself a command line interpreter (shell) like Gemini or gulam. Shells
usually do not convert arguments to upper case.

Michael

When I use zoo, which admittedly is quite rarely, I always type the
full command - i.e.
Double click ZOO.TTP (or whatever)
and enter
-extract filename.zoo
in the dialog box. You could probably get away with -x, but I don't
think it likes you to miss out the hyphen. Just a thought...

With good quality software I suppose you mean allthe crap that is being produced for these braindead machines like Windows and the like. Who the hell needs all that crap anyway. And by the way, the argument that there is lots of SW available for PC's, so what, most users only use a WordProcessor (like this shit product called WordPerfect) and maybe Lotus, so what is the use of so much software? If you don't know what you are talking about, then shut up. I am more than tired of the bullshit going around about PC's.

Do you know why your internal drive didn't want to work with the GCR?
Was it only with MAC/GCR disks, Spectre disks, etc? So far, Spectre 2.65
has been working with my MegaSTe's internal HD disk, though I have only
used Spectre format disks up to now.

Oh, what's the best route for upgrading the Spectre from 2.65 to 3.0?
I suppose I should send in my registration card, huh? :-)

I am rather pleased with the speed of the Spectre while in 16mhz mode -
things load in quite fast. Even my Megafile 30 seems to run fast under
Spectre mode!

From: mcsdc1ph@dct.ac.uk
Message-ID: <1993Jan6.133455.2652@dct.ac.uk>
Source record: 212685

Arghhh!

I'v been FTPing a lot these days, and have come across all the archived files like ARC, ZOO, LZH, etc and have some problems.

Is it possible to extract files from an archive onto another disk?
Most of the stuff I try to unarchive tends to be 600000+ bytes in length, and therefore obviously wont dearc onto the same disk!
Is there something special I have to do? Is there a particular dearc that'll do the job? Preferably a .PRG file, as I hate .TTPs!

Ah. The other problem! MSA files. I have 2 un-msa-ers:MSA.PRG and shadow.prg. What basically happens when I use it, is that at somepoint in the apalling process of swapping disks constantly, the drive suddenly starts to make noise more louder than I've ever heard, and it'll suddenly cough up an error and accuse the msa file of being corrupted or something. I have FTPd loads of MSA files and none of them work. It's really annoying as there are a lot of demos out there that I really want to get like Overdose, erotica, etc....

I'd be extremely grateful for any help with these vague problems!

FeekZoid

194. GCR on large screen

Newsgroup: comp.sys.atari.st
Date: 1993-01-06 13:44:40 UTC
From: csullogg@cc4.crl.aecl.ca
Message-ID: <6JAN93.08444068@cc4.crl.aecl.ca>
Source record: 212683

I use GCR on both a TT with a TTm195 (1280x960) and on a Mega4 with a REFLEX graphics card (1024x496 on an SM124 monitor). The REFLEX will not work in Mac mode at 800x600 (I think that's the rez) because of a GCR software bug; not because of the REFLEX card (at least that's what Titan told me).

GCR will not run on the TT's internal SCSI drive (dave promised an upgrade from 3.0 almost two years ago) so I run it from a SyQuest 88 meg that is attached to the TT. I have never been able to read/write Mac disks on the TT but have had no problem on the Mega (or a 1040 for that matter).

For those with an SLM605, try to contact Fearn and Music in Stuttgart Germany (if it is still in business) and get the SLM Init that lets you print to the SLM605 from MacWare (you'll need the MacPrint HP driver).

195. The fight of the FLAMERS!

Yoopeeeeyeah!
Finally the fight we have all been waiting for. Finally two of our best Atari-bashers :) are flaming each other.
Who wants to place any bets?
The odds are a bit better for Mark K, but I have more respect for Darek M's opinions because he seems more knowledgable.
But as we all know in flamewars facts are not as important as CAPITAL STATEMENTS!!!!

lets just hope this will make an end to all bashin of people in this newsgroup so we can continue to share information.

Erlend.

196. Short flashy STOS routines required

Newsgroup: comp.sys.atari.st
Date: 1993-01-06 14:03:06 UTC
From: evilandi@vnet.ibm.com
Message-ID: <19930106.060302.212@almaden.ibm.com>
Source record: 212684
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I would like to gather any short (ie. less than 10 lines) STOS basic routines which create special effects- visual or audio. You know, those quirky little lines of code which you knock together, and then can find absolutely no use for.

The routines are needed for my very last ST game, as I intend to get myself a Falcon ASAP. After a long and somewhat distorted discussion with two game magazine reviewer friends at The Raven Inn, Bridgnorth (where girls are real girls and boys are real girls, too), we came up with the concept for the WORST game EVER...

PRO INTERNATIONAL WHELK SIMULATOR 2000 PLUS ("SimWhelk" for short)

In order to compensate for the inevitably limited nature of the actual gameplay (aim of the game: not to fall off the rock), much of the program will be given over to a demo.

This game will be released either through Budgie UK licenceware or as Public Domain sometime before autumn, and will be written in STOS.

Contributions on this forum or direct by email please (preferably both!). Cheers in advance for anyone who contributes; you will get a heavy mention in the scroller!

Hi,

I am updating my software, that is to say I got rid of some pirated
software. So now I am in need for some commercial software to replace
the ones I deleted.
Unfortunately I am still just a student so I cannot afford to buy the
newest versions etc directly from HiSoft or so.
So if anyone has some software for sale I might be very interested.
You may send any offers to wmtwen@urc.tue.nl
I am really looking for some decent productivity software like a
wordprocessor , a spreadsheet and a drawing program. All for monochrome
monitor.

Erlend.

I should have included a little more information, sorry. The modem is a Cardinal 9600 (v.32, v.42, v.42bis; not MNP5). I'm running a Mega STE, Tos 2.05, with Serial Fix v1.1 in the Auto folder.

Our computer centre says their only supported protocol on the high speed lines is 7 bits, even parity. For what it's worth, my configuration in STalker is 7 bits, 1 stop bit, Parity 0 (Space). When I use Uniterm I find I need 8-1-none.

I've tried Zmodem again, with the -e switch; no improvement unfortunately. I've also tried Kermit with the packet length set to 2048 (seems to be the maximum accepted by the remote kermit) and *no* flow control. The file still comes through with no errors, but at about the same rate as previously, around 230 - 240 cps.

John

Mihocka may be a jerk, but to ignore OS/2 does _not_ make him a ceritfiable idiot. Remeber, Microsoft is "ignoring" OS/2, so do most "real" programmers.

IBM is betting against the continued success of OS/2, they layed off the development teams on OS/2.

It would appear that IBM has handled the OS/2 situation in much the same way that Traimiels inc have handled Tos/Gem, why would you think that any development that targets OS/2 will be commercially profitable?

By the way have you seen the book _Now that I have OS/2 loaded on My Disk, What do I do Now?_.

The real question would be should GEMulator be tested under NT? Do I really care about the answer? Would I want to support more Mihocka'isms. NO.

>market. Remember, I was referring to the last 7 years of the
>market place.

What you fail to realize is that, in making decisions about purchases in today's market, it is _only_ today's market that matters.

Your argument that because STs _used_ to be cheaper than PCs means they are better today is like saying that, because the Cray YMP was the fastest computer for the money five years ago still implies that it is the best choice today, which simply is not true.

Markets evolve, so what is cheapest today is not what was cheapest five years ago. Indeed, the XT->AT->386->486 route was not a good one for PC owners, but the 486 onward should be OK. Video modes are unlikely to improve much (except adding colors), and most of the PC hardware is stable. I forsee minor upgrades of PCs to be rather easy in the future.

This, of course, doesn't change the fact that PC operating systems are crap. Use that as your argument to promote the ST.

In short, your arguments are far from convincing.

>Mike M.
>
I know, this is not a solution to the above problems, but did you know that
it is possible to use the same floppy on Spectre and Mac without transverting?

First time I did not belief that, but its really simple to do!

Take a Mac that is able to read and write HD-Disks (i.e. has a FDHD Drive),
start Apple`s utility to convert files to MS-DOS (I don`t know the
english name of it) and select the menu entry to format a disk.
Normaly you have only the choice between formating 1.44 Mb or 720 kb MS-DOS
Disks or 1.44 Mb or 800 kb Apple Disks. If you click onto the disk icon
you are able to choose 720 kb Apple Disks. If you format
the Disk in this manner you get a 720kB Apple Disk, that is formated in MFM!
This disk can be read by any Mac (with FDHD) AND by Spectre 3.0 without any
additional tool!
By the way: this formating can be done by Spectre, too. The Mac OS on
Spectre believes to live on a Mac Plus with a FDHD with only double density.

Have joy

Gerd

>PCs are. But to claim that Macs are upgradable *is* just pure BS, in my book.

Ah, c'mon, Howard. These comments may have been close to the mark for the early Macs, but certainly isn't the case for any of the modular ones (LC, si, ci, fx, vx, vi, quadra, etc). The ci has a cache card slot, SIMM sockets, and 4 Nubus slots into which may be inserted graphics adapters, ethernet cards, accelerators, sound cards, video capture cards, etc. You don't even have to turn a screw to "pop the hood" for access to the motherboard.

Please don't take my comments, wrong. The original 520ST was an outstanding value in it's day and I _still_ believe that Atari systems provide a lot of "bang for the buck" given their ease of use and relative performance. But like it or not, Atari's are still basically closed systems... both in their architecture and the evident mindset at Atari HQ. ;-)

Then I stand corrected, Mike. I've seen Spectre running on a TT countless
times but it just never occured to me to see if it was using an external or
internal hard disk. Sorry, and thanks for the correction.

BTW, if you need to contact Gadgets by Small, I'd recommend sending a FAX as
Dave rarely checks into the Internet anymore.

206. Zterm & Spectre GCR

Newsgroup: comp.sys.atari.st
Date: 1993-01-06 16:34:45 UTC
From: yonder@netcom.com
Message-ID: <1993Jan6.163445.28826@netcom.com>
Source record: 212696

Maybe I should post this to one of the mac groups too, but I will start here. I am currently using Zterm (version .9 or something like that) with Spectre. I would like to be able to enter two different key sequences that I have not been able to figure out.

How do I send and ESC key? For example, I need to send and ESC when I am in emacs. The ESC key does not seem to function as an escape key under Mac emulation.

How do I send a ^_ (that is control-shift-underbar). The key sequence is used in Pine (to switch to alternative editor).

A quick browsing thru my Spectre docs did not get me anywhere. Is this a limitation of the Mac or Z-term that is causing my frustration?

Also does anybody suggest that I scrap Z-term for a superiour (share/free-ware) program ?

.........Thanks.... ...Chris

```

It's just for programmers' safety. When this magic number is not present in the parameter list for the XBios call, you might have called the Flopfmt() function by accident, instead of calling, say, Floprd(). Without the magic number's safety, off goes your data. With it, XBios returns an error code.

I don't know if there is a lot of demo makers but,in france there was one edited
called DCK ,these programm was a good one (but you can install it on a Hard drive).
It features a lot of scrolllings , rasters animations , sound drivers , starfields ,
overscans(low and top border), musix (soundchip and soundtrackers).Then the name is DCK
which means DEMO CONSTRUCTION KIT ....
Pascal.

Not workable because the bidirectional parallel port commo is entirely different. You would do better to look to the Mac ethernet boxes that can be put on the SCSI bus (assuming you have an ACSI<->SCSI Host Adaptor - but why bother with a network without one?)

> Is this anything more than an old man's wild ideas?

No, I think that with the Falcon's SCSI bus, the Mac ethernet box makers might be persuaded to make the necessary software available for all STs. Here's hoping.

>turn a screw to "pop the hood" for access to the motherboard.

The LC, LC II and IIsi are not exactly what I'd call 'modular'. Neither are the PowerBook series, Apple Computer's most popular selling machine at present.

The LC/LC II/IIsi have one slot -- and it isn't even a NuBus slot! True, you can "pop the hood" easily enough, and the SIMMs are fairly inexpensive. But if you want to put an ethernet card AND some other card into a Macintosh, just make sure you're paying more than $2000 for the system, since the low end systems only give you the one slot.

(This is the voice of experience. I had to reconfigure a proposed system due to the fact that an LC II has only one slot and would require a graphics adapter board in order to use a full-page monitor, while the IIsi with only one slot had the graphics adapter built-in. I needed that one slot for an ethernet card ...).

The lower end Macintosh machines are no more 'upgradable' than the Mega STe or TT. The PowerBooks aren't 'upgradeable' using any cogent definition of the word.

Can anyone tell me what the extension .SPS means? I assume it is a
spectrum graphics file, like SPU or SPC, but none of my spectrum viewers
will cope with it.

Thanks in advance,
Keith.

I also have this problem with Word Perfect and the latest MAcinTax.

It seems to be a problem with the INSTALLER.

I survive by installing on a real MAC, then use an archiever compresser
to put it back on floppies that don't need to be INSTALLED.

Another input. A friend (R. Dutt on the net) suggested that the following
also works:
1. copy each disk to be installed to a separate directory.
2. tell INstall that the disk it wants is in that directory rather than
a real floppy.

Hopefully others can comment on this INstaller problem and solutionig.

Message-ID: <ALBERTO.93Jan6164843@yamuna.cs.umd.edu>
Source record: 212758

Hi, a friend of mine has a very old version of VIPGEM, the spreadsheet program that he got when he bought his Atari ST1024 like 6 years ago. He has use it for all kind of works. Including database and structural analysis for buildings.

Now he has a PC Clone in the office and wants to transfer his precious worksheets to lotus or some other program. The problem is that the data format is incompatible.

Question: Do you know of any program(s) that is able to read VIPGEM data and generate Lotus or something else available on the PC? The program could be on the Atari or the PC side. He is desperate.

Jose Alberto.

Please answer by e-mail, I do not read this newsgroup and my friend does not has access to the net.

Gee whiz!! Here in Canada, my Atari supplier - (bit of plugging here) Replay Entertainment (Toronto - look it up!) is going to have a "Falcon" week on the 11th (or was it the 14th...well, next week!!) Anyway to make a long story short, the bloody thing's on its way (and yes, my developer is trustworthy!!) So if we up here in the Great White North are gonna see it (and salivate over it...) I'm pretty sure you guys in the States should already be getting it (or have it!)

From: alrashi@ecf.toronto.edu
Message-ID: <C0GG3B.6KG@ecf.toronto.edu>
Source record: 212761

I posted this thread quite a while back, but it did'nt seem to stir anything so here I go again. BTW, this is not (well, shouldn't be anyway) flamebait...

Regarding the X86 line...
Hey, I'm assuming MOST of you know about the big layoff by IBM in the last few months...Jeez!! Anyway, just wanted to tell all you hidden IBM advocates in ATARI advocating skins...IBM has their own problems too, eh? Just look at the P5 (or 586)... I guess you guy's in the PC world are gonna start feeling the money pinch pretty sonn if you want to upgrade. While everyone in the other computer markets keep "upgrading" their computers (dunno what to call it anymore; re:flamewar on upgrading...) at the same ap

proximate prices, all you compatible users will no longer be able to upgrade with "compatible" prices anymore.
What happens when Motorola comes out with the (in development) 68060??? This will surely blow away the 486 (not a jibe). The point is, 486 users will surely want to upgrade (human nature) but what will they upgrade too? IBM in their perilous position will have to sell the P5 at higher (maybe much higher) cost than other compatibles, as compatibles will no longer exist...(P5 will be copyrighted - or IBm will die). With all the trouble between IBM (one side),and Microsoft and Intel (the other side), I have

heard rumours (reasonably reliable and logical) that IBM is quite interested in Motorola's 86000 line (not sure), which are RISC based, to use in future computers. Maybe true (IMHO), maybe not...but it still highlights the fact that IBM is dissatisfied with Intel.
How 'bout Microsoft? Jeez, any idiot can see that IBM do not like Microsoft anymore (just look at the conflict between OS/2 and Windows if you don't believe me!). Or how about the new dos IBM releases?? IBM dos Version 5 ????? If these aren't moves to pull away from Microsoft, what is??
IBM, a company with conflicts with their biggest software supporter and even their chip developer... Makes you think doesn't it..?

How about Atari?? Jeez, close to another basket case!! Atari's fanatical supporters will continue to plug the Falcon.. but if Jack Tramiel (who is back from a long absence - notice the chaos in his absence) doesn't do something fast (which I think he is already doing... don't know what it is, though) the company's computer branch is sunk. The incredible thing is, without the ST or the Falcon, or any computers...Atari will not necessarily die! With their Lynx (more a scaled-down portable Amiga than anythin

g else) doing good business, Atari Games (which is at least paying royalties for the name Atari if nothing else- I don't know the story here...), and even the Atari PC (hey don't knock it, even Commodore PC's exist - I've used both) will keep Atari afloat...for how long, I don't know. Certainly longer than IBM, IMHO.

Y'see, Atari's in trouble..but owing to their RELATIVELY small stature (compared to the worldwide IBM), it will stay afloat quite a bit longer than IBM (with their rapidly failing RISC market and all)... So to all out, there there is "no fate but what we make..." <--- great line eh?? (got it from T2 if ya didn't know!)

Thanks for the ear, if anyone waded through this..
AcEzE

In article 22292@news2.cis.umn.edu, davidli@simvax.labmed.umn.edu () writes:
>
>The LC, LC II and IIsi are not exactly what I'd call 'modular'.

Dave, 'modular' simply means that the cpu and monitor are separate pieces, as opposed to the all-in-one concept of the earlier Macs.

>The LC/LC II/IIsi have one slot -- and it isn't even a NuBus slot!

OK, and how many VME slots do you have on the previous MegaSTe and TT? One, right? And how many VME expansion slots are there on the Falcon 030? Zip.

>(This is the voice of experience...

Yeh, yeh... how about the voice of *reason* on the net for a change?

>The lower end Macintosh machines are no more 'upgradable' than the Mega STe or
>TT.

Really? How long does it take you to reach the motherboard on a MegaSTe or TT? I still have nightmares of wrestling with the shielding on my MegaSTe. I find it much easier to push on two tabs to lift the hood of my IIci.

Hey, I LIKE Atari computers! But I'll be switched if I'm going to set back in my easy chair and sing the praises of Atari and be blind to the advances that the "other guys" have made over the years while Atari stagnates. It's BECAUSE I like my Atari computers that I get so p.o.'d when I seen Atari HQ make such stupid decisions... like their CLOSED architecture!

Howard said "you must be a moron if you think Macs are expandable." Well, you better go ahead and dust off my duncecap then fellas because I'd die a happy man if my Atari was as "non-expandable" as my Mac.

[good advice about case insensitve TOS deleted]

>Get yourself a command line interpreter (shell) like Gemini or gulam. Shells
>usually do not convert arguments to upper case.

Not to knock your advice, but I have had a problem with zoo that I just
cannot figure out. I am hoping that someone else with a similar configuration
can at least tell me that it _should_ work.

I have TT with color/4MBST/1.44/TOS3.06/105MBinternal.

With just AHDI5.0 loaded to mount my HD, I cannot run zoo on any known
good .zoo archives (uploaded them from the TT to a sun and unzooed them fine).
I have tried the "-extract" which should work regardless of case. I have
tried the zoo shell (.6). I have tried using tcsh (with and without MiNT).
I have tried it on floppy without AHDI loaded.

The symtoms are that I would run zoo, it would say "extracting filenam"
and then bomb with 2 bombs. It will have created a zero length file named
filenam. It does this (even the same number of bombs) regardless of method
of calling zoo.

To be completely honest, it had worked sporadically some 6-8 months
ago before I had my machine upgraded to TOS3.06. Then it stopped working (and
then I upgraded TOS).

Does anyone have a clue as to what might be causing this? Is there
a dip switch that might have been moved that normally wouldn't be causing
problems, but interferes with zoo?

Quester's Lzh has always (and continues to) worked. If anyone has a
clue, please let me know. I am presently trying to unzoo all of the MiNT/GCC
distribution disks and having to copy them to floppy, take them to my suite
mates computer to copy them, then unzoo them back onto the floppy, is starting
to drive me nuts.

Thanks in advance for any help.

csullogg@cc4.crl.aecl.ca writes:

>Question: Why did Windows only become popular recently?
>Answer: Until recently, no PC was fast enough to run it effectively.

On a similar note, I read a message a while back (I forget from whom)
about a text editor for the PC that ran "considerably faster" than
Tempus.

This may be true, but only because the hardware was upgraded at a
considerable expense.

When will people realize the scam that Microsoft is pulling? Remember
the 286? Remember that it only need 1 meg and a 20 meg hard drive?
Did it do everything you needed it to do? Pretty much. So why do you
now need a minimum 4 megs, windows, and a large hard disk just to have
a system that will run the standard software?

Microsoft is why.

Why don't they build better software and quit relying on faster hardware?

Money.

Your money.

It's funny, looking at how things develop. Sun totally wiped out Apollo, which
used to be the dominant force in the workstation market, by developing their
SPARC chip and licensing it out to other vendors. IBM is getting wiped out
because they began with a fully open system design. I guess there were just
too many little upstarts for their legal department to chase them all down.
(Notice how tightly they still hold the reins on their mainframe stuff. Except
for Amdahl tho, who would want to be *in* that market, I wonder...)

Registering the P5 name and design isn't going to save IBM, it'll just make
their bad position worse. (Of course, it's actually Intel that's going thru
the motions of trademarking the P5, since they designed it. It's probably a
good move for them, since they *are* losing money to the other 486 clones
that are out there. Note that IBM has developed their own 486SX clone already,

further evidence of their dissatisfaction with Intel...) At any rate, it's fairly obvious that open systems are the key to today's market, and if IBM is going to try to close down to a secret proprietary design, the market is going to say goodbye to them...

As for IBM's interest in Motorola - they have a joint development agreement to make the PowerPC series RISC chip. I don't think IBM wants the 88100 series chips for anything. NeXT and Apple seem to be the big contenders there...

Atari Computer Corporation would pretty much have to fold. Atari Games is totally independent. And thinking that Atari Computer could survive solely on their Lynx and PC sales is pretty irrational, don't you think? You've already pointed out how terrible the PC clone market is in the previous paragraphs, so why would you consider the Atari PC to be an asset at this point? The positions seem pretty irreconcilable, in my view...
>

In article <1993Jan6.182318.10233@cs.nott.ac.uk> pcxkrm@unicorn.nott.ac.uk (K.R.Marshall) writes:
>Can anyone tell me what the extension .SPS means? I assume it is a
>spectrum graphics file, like SPU or SPC, but none of my spectrum viewers
>will cope with it.

SPectrum Smooched or a special Spectrum animation file for use with Unispec.
Spectrum Smooched will compress the images more than SPC will. SPSLIDEX will
let you view the SPS files.

233. GNU ZIP v0.7 ported to Atari

Newsgroup: comp.sys.atari.st
Date: 1993-01-07 03:12:55 UTC
From: m91der@tdb.uu.se
Message-ID: <1993Jan7.031255.8152@tdb.uu.se>
Source record: 212775

Just a quick note: I've just uploaded the latest version of GNU ZIP to atari.archive as gzip07st.zoo. It should be downloadable from /atari/Archivers/gzip07st.zoo within a couple of days. This version doesn't include any really important changes, so if you've DL'ed v0.6 and found it worked then you don't really NEED v0.7. Just a couple of minor (noncritical) bugs removed.

I also tried to UL it to ftp.uni-kl.de, but the FTP-server doesn't want to let me in. Maybe tomorrow...

BTW, it looks like Jean-loup Gailly (the author of GNU ZIP) is really busy right now upgrading it, so new versions comes out almost on a weekly (or at least bi-weekly) basis. I'll port new versions ASAP, but due to the fact that I'm doing my military service now it could take a while from the sources are released to when an Atari-port is uploaded.

Happy packing!

I'm using the Freeze Dried demo right now. It works fine for the ansi
emulation. I'd like to know if the shareware version has more emulation
though. But I can say that the demo works fine. It's a nice program,
once you get used to it.

I hear good things about Stalker too.

>about a text editor for the PC that ran "considerably faster" than
>Tempus.
>
>This may be true, but only because the hardware was upgraded at a
>considerable expense.

Actually, no. Epsilon Emacs runs considerably faster than Tempus on a lowly 286/12, which is probably as slow as (of not slower than) the 8Mhz 68000 in the ST. Epsilon is also programmable in C, lets you edit multi-megabyte files quickly and easily, and just generally impresses the hell out of me. It's a programming marvel -- proof that even Intel-clone sellouts can write kick-butt code. (And you thought they were all mindless drones, didn't you?)

Faster than Tempus on a 286/12, yup. But you should see it run on a 486/33!

:)

>...286...
>Did it do everything you needed it to do? Pretty much. So why do you
>now need a minimum 4 megs, windows, and a large hard disk just to have
>a system that will run the standard software?
>
>Microsoft is why.

Oh please. MACH requires a lot more than that; are you going to blame CMU for "forcing people to get more hardware?" The 286 won't run any real operating systems (unless you count Xenix) because the chip isn't capable of doing virutal memory without massive hackery.

If you don't like Windows, DON'T RUN IT. I never use Windows. I hate it. If I wanted a GUI I'd use a Mac; at least they have a decent one. PC software that supports Windows always comes with a DOS interface too. You don't HAVE to have Windows.

>Why don't they build better software and quit relying on faster hardware?

Epsilon is an example of this better software. Boycott Microsoft if you don't like them, but don't take your hatred of them out on the Intel machines themselves.

238. NEW ATARI SUPPORT!!

Newsgroup: comp.sys.atari.st
Date: 1993-01-07 08:04:48 UTC
From: mcarrico@terapin.com
Message-ID: <mcarrico.34kc@terapin.com>
Source record: 212780

Due to requests, I'm reposting Operation: A.C.T. NOW information.

"OPERATION: A.C.T. NOW"

Atari Community Together Now

Campaign Organizers:

Len Stys, Mark Leair

Supported By:

The Cleveland Free-Net Atari SIG

"OPERATION: A.C.T. NOW" is a series of campaigns that will first help increase support for Atari ST and Falcon computers. If there is enough interest in Atari 8-Bit computers, the Portfolio palmtop, and the Lynx handheld video game system, this operation will support them as well. The main goal of this operation is to strengthen the Atari Community.

"A.C.T. NOW" stands for Atari Community Together Now. The campaign organizers believe that Atari users, developers, dealers, publications, and Atari's management must take action to save the Atari Community. Many people suggested that we forget about Atari's involvement. They claim that Atari Corporation will never participate in this operation, even if it will help the company greatly. They believe Atari's management doesn't care about the Atari Community.

If they are right, Atari Corporation will not be around much longer. The Atari Community is the company's only edge over other PC manufacturers. We can only hope that Atari's management realizes the importance of this operation.

The organization of "OPERATION: A.C.T. NOW" was no easy task. Many things needed to be considered such as who this operation should benefit. Should it benefit Atari users or Atari Corporation? We also didn't know if it should be run in a positive or negative manner. And if it should be "anti-Atari" or "pro-Atari." We decided that this operation should be run in the most positive manner possible. This is because nothing positive ever results from being negative. We also decided that it should benefit ever member of the Atari Community equally. This is the only way the operation will be able to strengthen the Atari Community. And lastly, we decided that this operation should not be "anti-Atari" or "pro-Atari", but "pro-Atari Community."

The first campaign in this operation will give you the opportunity to tell Atari's management everything that you feel the company is doing

right and the things that you believe the company can improve. This campaign will benefit everyone in the Atari Community because Atari Corporation will become stronger by the information that you provide them. And when a member of the Atari Community becomes stronger, the Atari Community becomes stronger.

The second campaign will ask publications to publish articles about Atari's new Falcon030 personal media computer. How will publicity help the Atari Community? Atari dealers will sell more computers, Atari Corporation will sell more computers, Atari developers will sell more products, publishers will have more readers, and Atari users will have more products to purchase and fellow users to talk with. We will also be speaking out for what is fair. Atari announces the new Falcon030 computer at the Boston Computer Society meeting and the nation ignores the company. Apple announces new computers every other week and every major newspaper and computer magazine in the nation publishes an article on them. This is not right. As members of the Atari Community, we need to stick up for each other.

There will be many other campaigns that will directly benefit Atari users, developers, dealers, and publications as the first campaign benefits Atari Corporation. But, every campaign will benefit the Atari Community. If you are interested in strengthening the Atari Community, join us... We can make a difference!

Sincerely,

Len Stys
Mark Leair

Cost?

There is no cost to you in any way to participate in these campaigns. There is no registration fee and no donations are being accepted.

Members Key to Success

The number of people participating in these campaigns are extremely important. We can accomplish anything together. The news of these campaigns must be shared with every member of the Atari Community that you know. "OPERATION: A.C.T. NOW" should be publicized in Atari publications, at Atari user group meetings, Atari shows, and Atari dealerships. If you take action, we can and we will make a difference. If you sit back and watch, we won't do anything.

Official Site

The Cleveland Free-Net Atari SIG is the official site of "OPERATION: A.C.T. NOW". If you wish to add any information or discuss anything related to this operation, a special section has been created specifically

for this purpose on Free-Net.

The Atari SIG can be accessed by the phone number "216/368-3888" at either 300, 1200, or 2400 baud. It can also be accessed by users from around the nation or world for free by using "telnet" at their college or business by the following Internet addresses:

freenet-in-{a,b,c}.cwru.edu = hela.ins.cwru.edu = 129.22.8.38

Type 'go atari' at any menu.

The Cleveland Free-Net Atari SIG's U.S. mailing address is:

Cleveland Free-Net Atari SIG
P.O. Box 364
Mentor, OH 44061-0364

The Cleveland Free-Net Atari SIG's Internet e-mail address is:

xx004@cleveland.Freenet.Edu

Online Newsletter

There will be an "OPERATION: A.C.T. NOW" online newsletter to keep members informed about what is going on.

A.C.T. NOW Directors

If you are interested in becoming an organizer of "OPERATION: A.C.T. NOW", please contact us by the address above. We are interested in having several people from each group of the Atari Community direct this operation.

Independent Operation

"OPERATION: A.C.T. NOW" is in no way affiliated with Atari Corporation. These campaigns are organized by individuals that have an interest in Atari products. The "Atari" name, logo, and any other Atari products mentioned are copyrighted by Atari Corporation.

"OPERATION: A.C.T. NOW" is supported by the Cleveland Free-Net Atari SIG, but individual SysOps and members may or may not endorse this operation.

+------------------+
| CAMPAIGN ONE |
+------------------+

The first campaign will be to compile two lists. One list will consist of things that we believe the company is doing right. Atari is doing great things and if you want to continue seeing the company doing these things, you have to let them know. The other list will consist of things that we believe the company can do better. The company will never

know the problems that you see unless you tell them. We will send these lists to Atari Corporation's Board of Directors and ask that they consider our suggestions. Will Atari listen? There isn't a successful company around that doesn't listen--especially to their customers, developers, dealers, and publications.

What you nee to do is write down everything that you see right with Atari and the things that you believe the company can improve. Include any past experiences that you have had with the company.

Here are a few examples:

RIGHT IMPROVE
Users
----- Great products, No easy memory
great price upgrade

Once took 4 months
to get my computer
replaced when sent
to Atari

Developers
---------- Good developers Took 3 months to
area on GEnie get a computer to
develop on

Great computers Atari was rude to
to develop on me when they first
showed me the Falcon

Dealers
------- Good dealer Shortage of products,
support even today

No new products

No co-op advertising
and lack of company
advertising
Publishers
---------- Atari advertises Slow to pay for ads
regularly

Does not give enough
new info to us

The comments made in these examples should not be taken as truth. They are simply examples. Also, your comments can be as long as you want. In fact, the longer and more detailed, the better.

If you wish to remain anonymous, you may send these lists in another envelope.

The goal of this campaign is to inform Atari of things that we believe can help improve the company's position in the computer marketplace.

All of the lists that are received will be compiled and then sent to Atari Corporation.

```
+------------------+
| CAMPAIGN TWO |
+------------------+
```

The second campaign is to concentrate on letting computer publications know that Atari is back.

The Falcon030 has been released in the United States. The amount of press that the Falcon receives will most likely determine when the Falcon will be shipped to the United States and the quantity shipped.

The Boston Computer Society meeting was not as successful as it should have been. This is because there was little press covering the Falcon030 announcement.

What you need to do is list names and addresses of publications that you wish to see have an article about the Falcon030 personal integrated

239. Re: Arcs and MSA help needed desperately!!

Newsgroup: comp.sys.atari.st

Source record: 212777

FeekZoid asked about unARChiving on floppy disks, and using MSA..

Charles F. Johnson of CodeHead Technologies has written an
excellent GEM based "shell" for the popular archiver programs,
called appropriately enough, ARCSHELL. It's ShareWare, and
should be available at atari.archive.

It will allow you to select the input drive and output drives,
which can be different drives.

If you have enough memory, a good solution to unMSA'ing files
is to create a RAMdisk big enough to hold the source file, and
unMSA directly to a floppy disk. That will eliminate the
disk swapping.

m>Small coming on ..

1. You can transvert Atari -> Mac and vice versa using RS232.
2. You can use MS-DOS Disks in 720K Mode using Access PC or DOS Mounter under Spectre, it works very well.
3. You can use Mac 720K Disks. It's not a joke, it works! Apple distribute a Programm with System and Finder, it's called Transverter(?) I think. In German its called "Dateien konvertieren". If it is running and you put an unformatted Disk into the diskdrive an alertbox apears on the screen. You can see there 3 entries like Mac 800K (standart Mac), Apple Prodos (Apple 2) and Mac 720K (disabled). When you click with your mouse onto the Disk-Icon in the alertbox, the Mac 720K mode is magically enabled. Then you can format your Disk as Mac 720K (even under Spectre!). But not all Macs esspecially old Mac Plus like this special Format. Newer Macs shouldn't have any problems with these disks.

Tschau,

Martin

243. Conner HD on a TT

Newsgroup: comp.sys.atari.st
Date: 1993-01-07 10:14:26 UTC
From: Jan_Willekens@p12.f202.n281.z2.fidonet
Message-ID: <2b4c028d@p12.f202.n281.z2.fidonet>
Source record: 212833

Hi!

Yesterday, I connected a Conner RZ23L hard disk (120Mb) as the internal hard disk to a TT (TOS 3.05, probably rev. C), but that combination doesn't work as it should.

At bootup, after I pressed the space bar, the hard disk LED remains on and the system doesn't see and doesn't boot from the hard disk. Now, I have connected another SCSI hard disk through an ICD host adapter to the DMA port of the TT, and the system does see that one and boots from it. After the TT has exited the driver software (ICD 6.0.4) the LED of the Conner goes out. If I then run the driver from the desktop or relog the hard disks, the Conner is seen and mounted by the system and I can use it perfectly. I only can not boot from it, and that is just the thing I want to! I have put the terminator resistors on the HD, so that's not the problem. I also have tried various jumper setting, but they didn't help.

I have heard that various problems are known when using Conner HD on TT's, so can anyone help me out? Or does anyone have some documentation on this Conner HD concerning the meaning of the various jumper settings??

Greetings... - Jan -

Your Syquest drive seems to be configured to send a UNIT ATTENTION message
after power-on. This collides with the first read request issued by TOS.
You might need to reconfigure your drive with some tool; maybe the
BOOTFIX program on your ICD disk already supports the Syquest drives.
If not, you should call ICD.

marco@sys6626.bison.mb.ca (John Perry) writes:

>I was wondering if anyone could recommend a modem/terminal program to use
>when I dial-up UNIX machines?

You'll need a good vt100 /ansi or vt200 emulation. In my opnion there
are only two alternatives, which go both confirm with tests for
this emulations. The one is he good old uniterm, a fast but not
GEM-based terminal. The second is my terminal programme CoNnect, which
is available in release 1.91 now runs completly in GEM and supports
all mamachines including the falcon. On a MEGA STE, the falcon or a TT
you even can use higher baudrates then 19200 (eg 38400 or 57600).
There exists and english version but no english documentaion so far.

Wolfgang

249. Picture Conversion Query

Newsgroup: comp.sys.atari.st
Date: 1993-01-07 12:10:04 UTC
From: mcsdc1ph@dct.ac.uk
Message-ID: <1993Jan7.121004.2670@dct.ac.uk>
Source record: 212788

Does any one know of a program out there that will do conversion of all the major picture formats, including GIF, IFF, and SP? ?

I'm working with a PC, an Amiga, and my trusty STe and at the moment am stuck with using Spectrum 512 for importing IFF pictures from amiga, which for some reason don't always come across very well.

(Incidentally, I'm not porting pics, I'm sticking them on a PC compatible disk, then getting amiga to read the PC disk, and vice-versa)

Does Ste have a true 4096 colour mode? Like HAM? Or does it have to be a spectrum pic for the full pallette?

Sorry for these somewhat vague questions, but I really am quite confused about the whole thing myself. What I'm basically after is a program like PICSWITCH, where I can load in a picture, select the new format and save off.

Thanks.

250. Tracker Music within GFA/STOS, how?

Newsgroup: comp.sys.atari.st
Date: 1993-01-07 12:13:30 UTC
From: mcsdc1ph@dct.ac.uk
Message-ID: <1993Jan7.121330.2671@dct.ac.uk>
Source record: 212789

Hi.

Does anyone know of a routine which will allow tracker music to be played from within GFA basic, and/or STOS?

Is it merely a question of know the proper locations within the tune code, or will I need a specific player routine with in the basic code?

I use an Ste.

By the way, how many channels has the STe got? In a certain demo called Dynamite, they claim to have 8 independant channels. Is there and editor for this type of wonder musix?

Thanks.

Are you sure you linked with libs that were also compiled with -mbaserel?
I compiled tcsh 6.00 and make 3.62 that way and it works just fine.

Regards, Markus.

> (I always get a disk error);
I don't know for sure, but I think you can only format 400 KB MFS disks.
You better set up a 2 MB MFS hard disk partition for converting or get AccessPC.

> 2 - I cannot get a full A3 Mac screen - the Mac does run on a 1280x800 screen,
> but it gives me 2 "squished" (and illegible) screens, side by side. In ST
> high res. emulation, there is no problem.
Be glad that it works at all with you graphics adapter!
Spectre 3.0 was not written for all sorts of screen resolutions...
Try to emulate 1280x960 TT high res (mono) mode, which works fine for me in
connection with the ProScreen 19".

Hope that helps,
Markus.

>(big tip-off there).
>
>So thank you all again!!!

Seems that no-one else suggested this. Use the "novice" command -extract
None of these are case sensitive so they will work on both the command line
or dialog box. Syntax is

-extract archvename file.....

And there is a difference between zoo h & zoo H. Look carefully. H gives
much more info & does not include the novice commands.
Here is the first `page' of each command

zoo h
=====
Zoo archiver, zoo 2.1 $Date: 1991/07/24 23:47:04 $
(C) Copyright 1991 Rahul Dhesi -- Noncommercial use permitted
Usage: zoo {acDeglLPTuUvx}[aAcCdEfInmMNoOpPqu1:/.@n] archive file
("zoo h" for help, "zoo H" for extended help)

Choose a command from within {} and zero or more modifiers from within [].
E.g.: `zoo a save /bin/*' will archive all files in /bin into save.zoo.
(Please see the user manual for a complete description of commands.)

Novice usage: zoo -cmd archive[.zoo] file... where -cmd is one of these:
-add -extract -move -test -print -delete -list -update -freshen -comment

zoo H
=====
command line format:
zoo {command}[options] archive files(s)

Commands:
a add files
u - update, replace only if file is newer than saved version
n - new, add if file is not in archive
f - fast, don't compress at all
h - high performance compressor, slower than default
M - move files to archive, delete after saving
c - add a comment to each file added
C - add a comment to the archive as a whole

```
: - strip directory names, save filenames only
q - quiet (qq suppresses warnings, qqq suppresses nonfatal errors too)
P - pack after adding, remove overwritten or deleted files
(leaves a .bak file, use PP to overwrite it)
I - read filenames from standard input
+ - enable generations
```

256. Anyone having problems with Newdesk??

Newsgroup: comp.sys.atari.st
Date: 1993-01-07 13:20:42 UTC
From: jonal@dhhalden.no
Message-ID: <jonal.113.726412842@dhhalden.no>
Source record: 212795

Hi everyone and a Happy New Year to you all!

I've been having a few weird problems with my TT - my keyboard shortcuts on the desktop gets trashed as soon as I use an application...

What happens is this:

I have defined shortcuts and have saved the NEWDESK.INF file. The line containing the sh/c's looks like this:

#K XX YY NN NN NN..... where NN, XX and YY are hexcodes for the characters used. I've marked out the two first codes as XX and YY because when I execute a programme and returns, my codes are trashed. The first one is OK, but the second one is altered and the rest are either arrows or closebox/ fullbox characters. When I save the NEWDESK.INF file or look at the memory the line looks like this:

#K XX Y#K XX YY NN NN NN NN NN .....

It simply adds the header + the first one and a half code to the existing string for no apparent reason. I have to re-edit my .INF file everytime I add an icon and stuff like that and my sh/c's are useless. Have any of you experienced this?

I'm using a fairly new version of the TT (1.44 MB drive) w/ TOS 3.06. 2 MB ST RAM (My GE-SOFT 32MB card came back from Germany today - I'll test it later on). No additional software loaded except the AHDI 5.00 driver.

Please reply if you've seen these things happen...

257. STalker vs Uniterm?

Newsgroup: comp.sys.atari.st
Date: 1993-01-07 14:18:38 UTC
From: yonder@netcom.com
Message-ID: <1993Jan7.141838.18899@netcom.com>
Source record: 212797

Does anybody have any opinions here? I have been thinking about plunking down a few bucks for STalker, since I spend most of my time on my computer logged on. Currently I use Uniterm. Uniterm does everything I need pretty much, but it has one or two bugs that bother me. Once in a great while Uniterm will bomb if some certain cursor positioning happens. For example, when I try to run Pine with Uniterm, I get bombs as soon as Pine tries to draw the "compose" screen. Uniterm is no longer being updated, so no chance of this getting fixed. I have to switch on my Spectre and load up Zterm if I want to use Pine at home.

One thing that I would like to know about Stalker is if it will allow me to have a 49 line screen like I use in Uniterm... this is essential for me (not I have a mono monitor).

Hello happy netters,
and best wishes to you all.

I've a problem with atari.archive: I can no longer access it by ftp;
any try ends like this:
---------------------- start quoting
530-
530 User anonymous access denied.
221 Goodbye.
---------------------- end quoting
I guess this is due to new access restrictions...

This would be no REAL problem if I was to download files,
as there exist mirror sites...

The question is: how can I **upload** a file ?
If anyone has any idea, I'd be glad to hear from him.

Bye.

I have used Z-term without much difficulty. It is the only telecomm prog
I have used that sends ESC when you hit the escape key on the atari.
Others usually require that you hit the tilde-backquote key. If escape
isn't working for you, I'd try the tilde key.

Yeh, sure. And all Americans (that's with a capital "A", please) wear sixguns and deal drugs on the street, too! This is more "only in America" tripe.

I agree that *most* Americans are very inward looking and isolationist by nature but hey, no intelligent human being likes to be stereotyped, OK? Next time, kindly use the politically correct "IMHO" for these grandiose observations.

And besides, most everyone knows the captial of Austria is Canberra. :)

MultiTOS is not available as yet, Wolfgang. It was supposed to ship with the new Falcons but has been delayed (what else is new?). Last I heard, Atari had not decided on whether to make it available for owners of pre-Falcon machines or not.

Maybe someone else on the net can give us an update on MultiTOS?

There is a problem with connecting these LAN adapters to the Atari ST.
As far as I figured it, the Atari is missing a couple of signals that
are available on the PC's printer port. So I doubt you would be able to
have them run on an ST. It might be different with the Falcon which is
said to have more signals on the printer port. Nonetheless the speed
that is achievable by the printer port (which is driven by the sound
chip) is very limited. Even if handshaking data is reduced to mininum
and if you use optimized assembler code to access this port, you will
probably only get less than 100KB/s. So using a port (such as the
ACSI-DMA port) that supplies built-in handshaking information will be
needed to do the trick.

>could get software only from the German companies at a reasonable
>price...
>
>Werner

A couple of friends of mine have been programming a network for the ST
for quite a while. The software is running very reliably --- in fact
this system has by now been in use for more than a year at my former
high-school and the computer science teachers are very satisfied with
it. Unfortunately there are still problems with the proprietary
hardware which will only allow for cables that are no longer than
30feet. Though this hardware is comparably cheap, which would allow
for selling the network as a low-cost alternative to products such as
PAM's Net or BioNet, my friend are on the long term looking for a
solution that is based on ethernet. As of now, none of them have been
able to find any of those SCSI<->Ethernet boards you have been talking
about. So, if you could provide me with the address of a place that is

selling those, you might, with some luck, be able to get the drivers within the near future. Adapting their software to new hardware should not be too difficult for it only requires replacing the transport layer; the existing software is quite modular, so I do not expect this to take more than a couple of days for getting a working alpha-release. BTW there are already several alternative transport layers, one of them is using the MIDI port (though that one is way too slow!) --- so it *is* possible to replace these modules!

I hope, these boards are not too expensive, since buying two or three of them for developing the software would be required...

I would apprecitate, if you mailed your reply to srb242@math.uni-muenster.de so it does not get lost in between all the other news :-)

Thanx in advance

Markus Gutschke

There is a PD extension called STOSTRAK (aka STOS TRACKER) by Francios Lionet which allows you to play AMOS .ABK tracker files from STOS. Included in the package is a converter from Noisetracker .MOD to AMOS .ABK.

The extension adds several commands to STOS Basic, and includes the relevant compiler extensions, too.

The quality of playback is severely reduced if you want to do other things at the same time (eg. scroller, sprites etc.), but hey, you can't have everything.

This is available from most UK PD libraries; I know Goodmans have it for sure, 'cos I wrote the text file for them!

Anyone needing help with the STOS tracker should contact me, as I have a fair degree of experience with it (check out my Budgie progs).

{sig deleted}

.SPS is the Smooshed Spectrum format. You can view/unsmoosh it with
one of the later Spectrum viewers such as spslidex (or some such - its been
so long since I got my TT that I have already forgotten a lot of ST specific
software - but I still wish I had a TT compatible photochrome (I think that
is the program that gives such great colors on an ST/STe) program - it would be
really cool to see some of those neat .jpg pictures in 640x480x24bit on
my stock TT).

That and a working zoo. :)

-MikeB

269. SPS files

Newsgroup: comp.sys.atari.st
Date: 1993-01-07 17:24:28 UTC
From: pcxkrm@unicorn.nott.ac.uk
Message-ID: <1993Jan7.172428.19665@cs.nott.ac.uk>
Source record: 212808

OK - thamks for everyone's response to the SPS problem (especially Dave's graphic formats posting - I should have looked there first!)

To summarise:

SPS files are compressed SPU files - but with a different, more efficient form of compression to SPC. The program everyone seems to recommend to view them is SPSLIDEX, which I've just downloaded from a.a. I'm fairly sure I had a version of this already, which didn't do SPS, but this might be a more recent one.

Thanks for all the replies!

270. Stalker vs Uniterm!

Newsgroup: comp.sys.atari.st
Date: 1993-01-07 17:37:46 UTC
From: csullogg@cc4.crl.aecl.ca
Message-ID: <7JAN93.12374686@cc4.crl.aecl.ca>
Source record: 212814

I used Uniterm for years and then moved to STalker when I switched to a TT with a 19" monitor. As I write, I have a window open with 55 lines and about 200 columns using a standard 10 point font (STalker lets you choose fonts).

The only complaints I have heard about STalker is it runs in a window and on an SM124 at 640x400 one line is lost for terminal use; with some applications this is critical.

I use it on an SM124 with a Reflex card (1024x496) on an old MegaST and it works great there too. I highly recommend it.

As I write, I am on a digital telephone at 19,200 baud to a VAX system. ZMODEM transfers to-from the VAX are a charm with ZMODEM when compared with Kermit via Uniterm.

Hope this helps.

Source record: 212813

My argument is STILL valid even in light of your comments.
I had stated that it was cheaper to dispose of STs than
PCs over the last 7 years. Your argument that this does
not apply to the present day situation because of PC
upgradability ASSUMES that an Atari is not easily upgradable.
Hey, I have recently boosted several TTs to 32 megs of
RAM; they can be boosted to 64 megs. Graphics cards are
pluggable, etc. You are assuming that Atari's will remain
less upgradable than PCs. We shall have to wait and see.

>
> ...stuff about XFORMER...

Looks like what I said a lonnnnnnng time ago about Gemulator was true.
I said D.M. was making Gemulator basically to sell only to ex-ST users
who wanted to throw away their ST and get a clone. He was providing one
more incentive (as if *that* was needed :)) to get a clone, because
you could still use your ST software.

Anyone who still thinks Gemulator is being made to convert millions
of IBM worshippers over to the wonderful Atari software base needs
some psychiatric care. He's doing it to hasten the Atari nosedive.
For the record, I still like the ST (actually the STe) a lot, for
several reasons, and have no wish for Atari to go under. Darek it
seems definitely wants them to go under.

Not true!! Quite recently (within the last few months Simon Poole released a slightly updated version (2.0e 015)). I understand the previous lack of upgrades was partly at least due to him having had a disk crash & losing some of the later sourcecodes. Still now there is every chance that further upgrades might be forthcoming.

W. Alan B. Evans
[wabe@ukc.ac.uk]

P.S. I found that Version 2.0e 015 can crash disastrously unless the default sizes of some buffer (the system one, I think) is increased slightly.

Source record: 212811

I have had some experience with both, although I may have an outdated version of Uniterm. So forgive me if some of these STalker features are also now available on Uniterm. STalker has a scrollable window, which is a feature I miss a lot in my Uniterm. You can set the font to 8x16 which I think will give you your 49 lines (never counted them though). You can set up a whole list of numbers and set up the terminal characteristics, and auto-login sequence for each, and have STalker dial each in turn if yo

u want. And have it keep track of how much you're paying for your online time.

You can cut and paste right on the STalker window - another Uniterm non-feature I miss.

The nicest thing for me is that is interacts with STeno, so that you can can cut and paste between the two with ease, or use STeno as a capture buffer for STalker, or display them next to each other, etc. Plus both STalker and STeno are desk accessories.

The bad thing is that for some reason STalker stopped working for me. I upgraded my ST to 4 Megs, and it continued to work for some time, but now the modem exhibits a delay of over half a minute with every command I send it or send through it to the remote computer. I reloaded the original software onto my hard disk but this didn't help. Uniterm continues to behave as expected, so I just use that now in my laziness (er... lack of time) to find the source of the STalker problem.

But I'm sure that problem is specific to me. It was working fine for me for over 2 years. I'd still recommend paying money to get STalker's features.

- Glenn

>One thing that I would like to know about Stalker is if it will allow
>me to have a 49 line screen like I use in Uniterm... this is essential
>for me (not I have a mono monitor).

This is the one thing STalker seems to get wrong. I tried a smaller
GDOS font in STalker to try to get more line/columns on screen, but
STalker just shrinks it's window down to 80 col/24 line. I tried to mail
Eric about this, but it seems he no longer has Usenet access.
From what I've seen, your best bet for this is ConNect. It allows
this, and even supplies a few smaller GDOS fonts for the purpose. The
only thng I don't like about ConNect is it's dialer, but that's a minor
complaint.

If you turn off word processing mode in 1st word it will save the file
as ascii. Of course, you lose the word processing stuff :-)

I think it's been about a year since version 2.0e 015 came out;
somewhat more than "the last few months."

At the time of the update, Simon said something to the effect that he
doesn't do much ST work anymore, and that this would probably be the
final update. Apparently he spends his time programming Crays now.
Slight difference in computing power :-).

Not that 1st Word is a good editor (echhh) but can't you do a "SAVE AS" (ASCII)
with it? I no longer own First Word but I thought sure you could.

For a commercial editor, I still like Tempus. There are good PD ones, as well,
but I'll let someone else comment on those.

This is probably the biggest problem with Uniterm; if you've got a big screen, it can't take advantage. Of course, that's not what it was designed for.

>The only complaints I have heard about STalker is it runs
>in a window and on an SM124 at 640x400 one line is lost
>for terminal use; with some applications this is critical.

I've also played around with CoNNect; it works VERY similarly to STalker. They're highly competitive, having surprisingly similar features. If CoNNect could run as a desk accessory, it would be hard to tell them apart.

CoNNect does better VTxxx terminal emulations, and is able to handle virtually everything up to a VT220. I've used some nasty applications under it like GNU-Emacs, that takes the termcap virtually to its limit, and never had a problem.

STalker isn't as good in this category. The best that you can get is an "ANSI" terminal emulation.

>I use it on an SM124 with a Reflex card (1024x496) on an
>old MegaST and it works great there too. I highly
>recommend it.

STalker IS good; and the fact that I (and probably Craig) know the authour has nothing to do with it.

>As I write, I am on a digital telephone at 19,200 baud
>to a VAX system. ZMODEM transfers to-from the VAX are

Well, I'm somewhat biased towards a commercial editor called Sudden
View. I've only played with Tempus (there's a demo on atari.archive);
I think that SV is faster. It FEELS faster.

For PD stuff, there's lots of stuff out there:

Emacs clones
vi clones
origami (a "folding" editor - before I got Sudden View, I used
Origami. It is pretty nice.)
Alice - a German editor, very similar to STeno (the GEM Desk
Accessory). I probably should upload a copy...

Check on atari.archive.umich.edu, in /atari/Editors. There's got to
be something there that you'll like.

Hello,

I'm looking for an old supra or such 10 meg shoebox (with
working drive.) I know many of these beasts must be out there, anyone
want to get rid of one. I'll pay a reasonable price for the drive,
provided it has two DMA ports on it. But by the same token, I am
not going to pay THAT much. Look at the technology and speed of
such a beast. Anyone interested please contact by e-mail, or leave a
message @ 1-603-868-3591

The Airball I know (written in 1987) has been made shareware, and can be gotten almost anywhere for $3 or less.

Interesting game, by the way, especially in VGA. Haven't seen the spellbook yet, but I've gotten the Buddha and have at least seen (died in the same room as) the Dragon Statue. Lots of interesting geometry and time problems to solve.

Way back in the "good old days" before GCC took over all the HD real estate I seem to be able to find, I used HSC and a hacked version of dLibs.

For a long time now, I've been tinkering with a small/fast variant on Dan Conroy's original MicroEmacs that was hacked for dLibs, converting it to ANSI C and GCC and such, and as a result find myself needing an equivalent of the dLibs fullpath().

For those of you not in the know, fullpath() would take a non-absolute filespec (".\wombat.txt", "\frob\foo\lump\minor.mad", whatever) and return to you an absolute pathname--that wonderful long thing with drive spec and all that's such hell to type.

Now I've been looking through the GCC libraries, and the closest thing I've found is _dos2unix() and its variants. My question is, does that actually resolve relative or incomplete pathspecs to be "canonical", or does it just flip the path separators.

The answer to this question, plus any pointers on its use would be much appreciated. I've got the source, it's just a little more...involved than I care to get right at this particular moment.

Thanks,

Glen Deardorf, check to see if you have STalker set to print to printer without a printer connected/turned on. That gave me the symptoms you described when I did it by accident (printer turned off). I was getting a printer timeout every time it did anything.

I wouldn't say I hate them, I'd say I'm strongly opposed to buying one.
It looks like a no-win situation. In the end, you get the most power
and support from the clone line for an astoundingly low cost. The clone
merchants are busy running each other out of town and we benefit. The
problem is that I like my Atari much better. Which is why I'm still
using it.

Eventually, when I upgrade, it will not be to another Atari. As much as
I'd like to buy one, there's no way in hell I'm going to buy a computer
that nobody will write software for. My first computer was an Atari 800
and I've always owned one (5 now.) But I've've never understood the fanatical
Atari fans. People, it's not a religion it's a business. And a really
poorly run one. If they don't put out they don't get my cash, period.
Up until now Atari has treated me great. But as the local dealers drop
like flies, I can sure see the handwriting on the wall. Which is another
reason I'm against getting a clone - because if I want to keep using a
computer eventually I'll have to buy one.

As for the GUI argument, I personally could care less. I don't need icons
at all. But to use the newer software for the clones you are going to
need to run windows. And you can bet that Microsoft will be there with
new ways to suck your money every step of the way. And when Microsoft,
with it's strangehold on the market, continues to develop software that
requires faster, bigger, and more expensive hardware, will I be surprised?
It's such a crying shame to see all that lighting-fast hardware being
wasted on a bulky, inefficient shell for an antiquated OS.

It's very clear to me that the IBM/Clone systems are in the business of
raking in dough while ignoring common sense.

Forgive me if I'm wrong, but I believe you CAN save 1st Word Plus files
as ascii files by first switching off WP mode under the EDIT menu, then
saving the file. In other words, open a previously created file, switch
off WP, then use SAVE AS... under the FILE menu, name it what you want,
and presto... ascii file! :-)

By switching off WP before creating a document, it will be saved directly
as ascii without any format or layout imposed by 1st Word Plus.

Hope this helps,
Bruce...

If I remember rightly (it's 7 or 8 years since I touched :-), you save in ASCII in 1W
by deselecting "WP mode" in the File (??) menu.

Also available in The Netherlands!

We, Computer Science department, Utrecht University, are running an anonymous FTP server on one of our systems. In addition to the FTP service we're also running a mail server, for those of you without direct Internet access.

--> How to get 'EDITOR-INDEX' via anonymous FTP:

Site: ftp.cs.ruu.nl [131.211.80.17]
Login: "anonymous" or "ftp"
Password: your own email address (you@your_domain)
file: /pub/ATARI-ST/editors/INDEX

--> How to get 'EDITOR-INDEX' via e-mail from our mail-server:

NOTE: In the following I have assumed that your mail address is "fred_flintstone@stone.age.edu"; of course you must substitute your own address for this.

| Please use a VALID DOMAIN ADDRESS.
| Use 'hip!hop!user' if you must.
| Never use an address which has both '!' and '@' in it.
| Bitnetters use user@host.bitnet

Send the following message to
mail-server@cs.ruu.nl
or the old-fashioned path alternative
uunet!mcsun!sun4nl!ruuinf!mail-server

```
begin
path fred_flintstone@stone.age.edu (SUBSTITUTE _YOUR_ ADDRESS)
send ATARI-ST/editors/INDEX
end
```

The path command can be deleted if we receive a valid from address in your message. If this is the first time you use our mail server, we suggest you first issue the request:

```
send HELP
```

A complete "ls-lR" listing of the archive is kept in the top-level directory, it will be updated every night. To get it, issue the command:

```
send ls-lR.Z
```

That's all for now. If you encounter problems using the FTP service and/or the mail-server, feel free to drop me a line (by e-mail, please).

Regards,
- Ate -

Well, just to put things in perspective, I know nothing about the geography
of America. All I know is that New York is on the East and Los Angeles is
on the West. I suppose for most American TV that we get, that's all I need
to know. Oh, yeah, Florida is quite hot in the summer!

But lets not start raving on about that. I think the A.C.T. Now idea
is extreamly good. As a humble user I am really looking forward to
utilising the Falcon's Sound & existing MIDI capabilities. Maybe I can
get my electric guitar to produce some excellent chorus and reverb. effects
by going though the DSP. Is anyone releasing GCC libraries for the
Falcon's extra capabilities?

Still, America may not be the only country on the planet, but come on, we all know that it is the only one that counts (ooops, better stick in a quick IMHO here before I get burnt to death). Anyway, given that Atari is a US based company I guess that they are a little more likely to 'listen' to people in the US ('listen'? Did I say listen and Atari in the same breath?).

Of course everyone knows that the capital of 'z' is 'Z', but this is largely irrelevant.

Mark (I'm from England - and no that does not mean that I come from London).

I'm starting to wonder if I'm the only ST owner in existence who uses Pro*Ed by Jerry Cole... I got it way, way, way back when (circa '86 or '87), from a friend of mine who beat me to an ST purchase by about a year and a half. I've never seen a reference to Pro*Ed here on the net. Strange. I don't even know if it's available from atari.archive. I do know, though, that it's PD... At any rate, it's a decent editor -- not great, but decent. It has some nice features and some un-nice features, but I still use it for most of my day-to-day editing when I'm using my ST.

If anybody cares, I can provide more information via email.

Oh, yeah -- please reply to:

Warning: the game requires a color monitor and a STE, no ST...

Second warning: I'm not the author, only a player;
but I find it's so good that I must tell this.

I've found it the other day on the (German) Clausthal site in the games dir.
Thought it was not on a.a.
But, yes it is: in the Ste directory.

Basically, it's a COLUMNS clone, but with a lot of (very funny) samples
and a lot of various gadgets likes bombs, randomizers, etc...

I almost do nothing else but play it since I've got it...
Even dropped the new (1.2) version of my own game Hexmines!

Oooh, I forgot: its name is "BLAT", lharc archive,
420 Kbytes long, a full floppy when unarchived.

Happy week end to yo all.

It depends what tracker modules your'll talking about.
I bought TCB Tracker and that came with various routines including STOS
and I think, GFA.

I'll toss in my vote for STPage, also at atari.archive.
Small (<13K) and quite fast; I can't compare it to any of the commercial stuff, but it's much faster than anything else I've seen that's PD; paging down through a file is very quick, and searches are also. The only complaint I have had is that it doesn't recognize tab characters; if it reads one in a file, it deletes it, and if you use the tab key, it inserts the spaces needed to get to the tab stop rather than an actual tab character.
The editor has a lot of features for such a small program: search/replace/delete/move/copy etc. It isn't Gem based, but does have easily used drop downs and uses the GEM file selector.

I searched for quite a while for a small, fast editor to use for my source code, and I haven't found one better than this.

316. Re: Spectre & TT

Newsgroup: comp.sys.atari.st
Date: 1993-01-08 15:23:46 UTC
From: afsfpel@cidsv03.cid.aes.doe.CA
Message-ID: <1993Jan8.152346.29269@cid.aes.doe.CA>
Source record: 212552

I won't repeat everything that's been written so far about using the
TT's internal floppy drive with Spectre GCR, but there is this notion
going around that you can't use 800K Mac floppies on a TT/Spectre. I
would like to dispell that notion. :)

I use floppy disks with Spectre 3.0 on my TT, all the time. But
before I can do that, I have to perform a little voodoo, as follows:

1. Turn off CPU cache.
2. From the Atari desktop, format a *double density* floppy.
3. Launch Spectre.

After that, I can read, write and format GCR disks without problems.
This works _every time_ on my TT, and at least one other that I know of.

The main disadvantage of this trick is that you have to wait for a
whole floppy to format before you can use Spectre. So, I wrote a little
brain-dead hack that formats just one sector on each side of a floppy.
If I run this program, instead of step 2 above, everything still works
fine under Spectre.

I give you this trick to try out, but since I don't know why it
works, I can't guarantee anything.

Cheers,

We had the same problem with several discs on PeCe.
Sometimes it was possible to shift the date of the final dead of the disc
by about 1-2 years by ajusting the little spring in the mid of the wheel.
There is also a small piece of coal, which can be "refreshed" by using
sand paper. But be very, very carefull.

I would recommend to do this "improvements" as late as possible (will
mean: when the disc stopped working), because you can repeat the procedure
only limited times.

If by this you mean, "where do I get the TOS 2.06 chips?", you have to get
them from an Atari dealer or direct from Atari. In the US, another source
has been CodeHead Technologies, but I'm sure of their availability now.

Not always: There are drives where this contact also is used for the motor.
Together with the noise the resistance increases and finaly the motor is
to "weak" th reach the correct speed.

Message-ID: <1993Jan8.153014.15430@csi.uottawa.ca>
Source record: 212553

It looks like it may be a fairly nasty compile, if it is possible.
Some fairly arcane knowledge of UNIX and C is certainly necessary,
since it's a little hard to run the CONFIGURE file under TOS or even
MiNT.

I'm looking at it. No long term promises.

It may be possible to get "sc" running (a non-GNU project spreadsheet).
I'll check.

It's not TOO important to me, as I have LDW Power. However, more tools
is always better...

>
>And how are we gonna see the difference between .Z and .z under TOS
>on the Ataries?

1) GZIP knows the difference in format between "compress" files, and
"ziped" files. It will probably be subsuming the code of classic
compress Real Soon Now, so that it won't matter which program was used
to compress, GZIP can be used to uncompress it.

In short, you don't need to see the difference.

>What's wrong with the old .ZIP extension ?

Nothing.

GZIP doesn't support "multiple file archives." That is, it is not a
direct competitor with ZIP, because it currently deals with only
single files.

The main thing that it has in common with ZIP is the fact that it uses
the same compression algorithm.

The two formats are likely to co-exist, at least for a while.

Source record: 212557

Happy new 1993 everyone!

As my namesake (no relation I think!) wrote about STOS Tracker players yesterday I'll mention a program I've developed called TrakBase for the STE which installs routines for using Tracker .MOD files in memory at bootup and then points to them with a cookie.

I use it all the time with GFABasic 3.5 and I suspect it could work with C as well. I'll be writing docs for it soon (uni work permitting) and then if anyone wants a copy then mail me at dxo@uk.ac.bham.cs.

You can start, stop, pause music as well as reading/changing many parameters (position, channels playing etc) at any time. I'll also be releasing DeskTracker a desktop front-end (which is very cool indeed, even though I say so myself!)

One could replace 'Darek' with 'Atari Corporation' and come up with a similar conclusion. Then again, many attribute 'evil' to a situation where stupidity would be the closest explanation.

Ok, but an important question seems to be:

If you get Word 5.1 installed somehow under Spectre, does it
run perfectly? Or crash, misbehave, etc.

Take at look at your newdesk.inf file. Look for the line that starts with a #G and has the *.PRG in it. You should also have this line the exact same except for *.APP in place of *PRG Add this extra line to your newdesk.inf file, and all should be well.

An even better idea is to drop MSA completely and use Chaos Disk Compactor. Not only does it eliminate the disk-swapping on single-floppy systems, it also compresses much better and can decompress both it's own files (CDC) and MSA files.

As for better compression, Jam Packer with LZH compression does great disk packing, but it's slowwww... (speed is traded for packing power).

No, he means _real_ operating systems, like OS/2. You know, that
multi-tasking, multi-threading OS from IBM? The one that does better
DOS than DOS?

The ST has some good software, but the clones have TONNES of good
software, and some GREAT software. Where is CorelDRAW! or MicroGrafix
Designer for the ST? Well, I could use Avaunt-Vektor, which costs about
3x-4x what they cost, and that's about it... so much for choosing the
best one, right? Good word processor that doesn't take over the whole
screen when it runs? Hmm, can't think of one... Hope all the word
processor users on the ST don't want to use MultiTOS.

Unless somebody can convince me otherwise, I think I'm going to buy a
'486 and run OS/2. It's almost like unix, but with real applications...

Or, buy some of the decent hardware that Microsoft has made cheap, and
put a REAL operating system on it, like OS/2, or any of the _free_ unix
implementations (with X).

> Accessory). I probably should upload a copy...

Several others I've found I like. Emac3.11 has a really nice Gem interface, making learning emacs a lot easier.
7up is a good editor that allows previewing of page layout, and one of the best double sided printing setups I've seen. Also it has an interesting "block calculator" that lets you mark a block and calculate totals, averages, and several other things I haven't figured out yet. Also, this same block marking allows you do block copy partical pages vertically, so you can cut a column from one page, and paste it beside a column on another.
QeD is a nice editor that runs as a program or accessory. It has a grep-like search routine which also works on disk, and the files found are put in a .prj file, so you can load several files after finding an expression in them.

You weren't paying much attention to Atari's last two "new" computers,
were you? MegaSTe and Falcon030 are _barely_ classifiable as expandible
and upgradable. There is a serious lack of modularity in Atari's
designs, and they don't seem to keen on fixing that shortcoming. After
all, they've been listening to us complain about it for _at_least_ seven
years now.

Funny, I use the 9-point Gemini Bold font from the Gemini 1.21
distribution and get an 80x25 terminal window (without the horizontal
scrollbar, which I hate) on my 640x400 screen... There's even space
around the edges. Or I could use the 8-point Gemini font, which I use
for my console window (windows under MiNT), and have the window take up
a bit more than 1/4 of the screen...

345. Convince me to stick with Atari.

Newsgroup: comp.sys.atari.st
Date: 1993-01-08 22:55:56 UTC
From: cherborth@semprini.tdkcs.waterloo.on.ca
Message-ID: <H.ea.o3KuEmskWp2@semprini.tdkcs.waterloo.on.ca>
Source record: 212413

I'd like to hear some arguments convincing me to stay with a sinking ship, Atari.

In 1986 I bought a top-of-the-line, leading edge piece of hardware, a 1040STf with a colour monitor. Seven years later, this computer is far too slow for the things I do (even for _programming_; forget DTP, animation, and rendering). It's a dead-end for the things I _want_ to do when I graduate (human interface design, learning research, human factors research, etc), and the things I do now in the real world (technical writing). It's still servicable as a word processor for school and it (eventually) gets the job done for some of my other interests (programming). And I've got some fun games. :-)

I'd like to know why I should buy a TT or Falcon030 (but I would never consider the current model... too limited, too much of a hassle to set up properly on my desk, too expensive for what you get) instead of buying a nice new Mac IIci or IIvx or IIvi or whatever I can get a good deal on. You can't give me arguments like, "I don't like the interface!" (after all, I've been using Spectre for about two years now), or "I don't like Apple's lawyer squad!". I want real, useful, _convincing_ arguments. And yes, I'm already aware that there aren't really any decent games for the Mac... That's changing though, and I don't usually play that many games (other than NetHack/Omega).

Let 'er rip folks. If I'm going to have to replace all of my software anyway, I'd rather do it with _quality_ software with a decent interface. Right now, a '486 system with OS/2 on it is looking _very_, _very_ attractive.

In a previous article, richard@op.ph.ic.ac.uk (Richard Syratt) says:

>
>Well, that started off on the wrong foot. Maybe these guys should have
>looked at an atlas before they started. I'm talking about the registration
>form, USA isn't the only country on this planet...

The REASON that other countries were NOT included in this operation was
not because you aren't significant. In fact, you are probably more
significant than the United States where Atari is concerned.

The problem is that the organizers of this operation have no clue as to
the current market conditions in your country.

The organizers would be stupid if they started campaigns to get Atari computers
sold in shoe stores in your country because they didn't know that they
were shoe stores to begin with.

The only way that an operation like "A.C.T. NOW" will be successful in
your country is if it is run by someone that knows what is going on
concerning Atari in your country--YOURSELF!

I would advise ANYONE interested in starting up an "Operation: A.C.T. NOW"
in your country to write the organizers in the U.S.

>
>What do atari think of this anyway? have they been 'warned' about it?

Well, Atari KNOWS about it. The problem is that they probably will not
get involved.

What do you think would happen if Atari actually worked with the Atari
Community?

What do you think would happen if Atari said, "Hey, we are trying to get
Atari Computers into MicroCenters and if you guys write them, maybe we can
get them in there."

What do you think would happen if Atari said, "Hey, we are trying to get
Word Perfect to write a new version for the Falcon030, if you guys write them,
maybe we can by typing on the latest of Word Perfect."

What do you think would happen if Atari said, "Hey, we are planning a major
promotion of the Falcon030 computer in MARCH of 1993 and if everyone
tells their friends about it, maybe we can make it successful."

Do you know what would happen? We would probably help out and make the
Falcon030 a success.

The problem is that I think the company would rather go bankrupt then to ask the Atari Community to help give one big PUSH.

2 ergonomic jouysticks for the Atari ST or STE ..... $20 each

********** or both for 35$ **********

These are very fancy joysticks which cost $40 each, new.
Designed primarily for right-handed people, the base is
molded to fit in your left hand, allowing you to use the
right hand to move the stick. They are in great condition.
I am selling them because I no longer own an Atari. I think
they may also work on Atari video systems because, I think that
the joystick interface is the same.

>The problem is that I think the company would rather go bankrupt then to ask
>the Atari Community to help give one big PUSH.

The question arises: why the *#:&#: does Atari have this attitude? I agree, it's like they ENJOY shooting themselves in the foot after making a really neat new gizmo... I'd love to buy a Falcon, I really would... But like a lot of other Atarians, I'm still in wait-and-see mode. I have to say I probably won't buy a mac. At $300 for X windowing software and similar absurd prices for most of what else I'd want, I have no use for the company... However, all someone has to do is add the right few co-processors to a clone and I'm gone... Don't think that will happen for a long time yet though so once again I'm back in wait-and-see mode...

Scott

My question was plain and simple. Was GEMulator tested under OS/2. Mr. Mihocka's response was that it was not his responsibility to test it even though he teste it with:

A) MS-DOS
B) DR-DOS
C) Windows

He pointed out to me that the GEMulator is targeted at, "cheap Atari users buying cheap 386 and 486SX clones." I am not in this cathegory since I own two PC systems, both loaded with 16 and 32 MB of RAM and one 486/50 and the other 486/33, both DX system.

He stated that I can return the GEMulator board if it doesn't work but if I would do it, I want it in writing. Mr. Mihocka, I can understand your arguments up to the point when you bring it and accuse me of spreading FUD. Furthermore, stating that it is my own uncertainty of OS/2 running DOS programs. It is no news that OS/2's DOS is better than DOS but like with many Microsoft folks, and they have done it before, they are very famous to buil "traps" so certain programs will not function with OS/2. Latest example is NT and OS/2 and their multi-boot facilities.

While a little more professionalism would be appropriate, the answer was more or less understandable.

Best Regards,
Mark K.

I am sorry but I have to take offense to your message. I cannot believe
you and all of the rest of the crowd who feel this way. Who the HELL are
you? Are you some computer CEO God who has SICK rage to KILL the owners
of a company just because you don't like the way they do business. Are
you that superior? You bought a F*cking computer from a company who you
don't like. Where is the reason to demand death to the owner? You and
your satanic clan have no part in the information sig. You and your
wicked mind have no place in any sig. or on any net. or anywhere on this
earth!

It is not a case of being facetious or no. You are COMPLETELY out of
line here. To ever (_EVER_) wish death on a CEO because you don't like
the way he runs _HIS_ company is absolutely outrages.

....sigh....the insanity and immaturity of people like you saddens me.
It is hard to believe the mentality of you and your kind.... :^(

h> anyway? 7.15, 7.75, 14.5, etc......)

They're usually artifacts of the video rate, so that the processor can remain synchronised with the video hardware.

Like the good ol'mac plus, where at the end of every scan line there's an interrupt, and the processor has to scoot off and stuff the next 512 bits of video data into a shift register... If the CPU is out of whack, things could get a bit messy...

BB> The point that michael.smith seems to be trying to avoid is that
BB> PC based computers CAN be upgraded, no matter what the "little"
BB> hassles may be, while ANY Atari computer CANNOT be upgraded without
BB> doing a lot of "hacking and slashing"...

I'm not 'avoiding' anything, Bob, that's one of your favorite tactics...

I'd say the level of 'hassles' involved would generally be about the same for adding things : mew drives are easy - overscan costs less in time than a video board does in money, and soforth.

BB> If you need to take an hour to install a '386 board into a '286
BB> computer, then maybe the girls in the Terminals department could
BB> help.. they do it all the time. Upgrading computers is one of the EASY
BB> things to do, IF the computer is designed for it..

Hmm. You rely too much on your terminal girls Bobby - let me introduce you to the fact that only _some_ PC's are well-designed for upgrading.

You remember those popular PC-XT cases? You remember how you have to take all of the interface cards out, then the whole front off, to get the drive frame free? and even then, it's impossible to support the inner side of one pair of drives? great stuff...

Or the Baby-AT cases where you have to remove the power supply, then hold your heart in your mouth as you unscrew the drive frame from the bottom of the case with the unit upside down and 2 inches of air between the frame and the bench?

Not to mention the fact that you're _real_ lucky if all the screws go back in where they came from.

BB> So what's your point..?
BB>
BB> Are you trying to say that "all PCs suck and we all know it" and
BB> Atari rulez..?

No : I am simply putting the lie to you saying 'upgrading a PC is easy'.

It's not. Small things, yeah sure, but doing anything major to a PC is just as bad as any other system : atari, mac, amiga, sun, cray, you name it.

BB> Sure there are compatibility problems in a platform that allows
BB> expansion.. but are you trying to say that the ST platform doesn't

BB> have compatibility problems BECAUSE IT IS NOT EXPANDABLE..?

No, however I'm a bit subscriber to the LCD argument - having a functional
LCD makes life much easier from a programmer's point of view.

BB> Sounds pretty silly, Michael...

Just gotta learn to read what I write, not what you want to see.

357. The compatibility story (Falcon & A1200)

Newsgroup: comp.sys.atari.st
Date: 1993-01-09 13:20:32 UTC
From: jornmoe@fredrik.atari.no
Message-ID: <H.mcBUgFWEjuY@fredrik.atari.no>
Source record: 212590

Comodore officialy say that 60% of current A500 software works on the A1200.
Impressive? I don't think so!

Compo (large german company that develop and sell ST/TT/Falcon software and
hardware addons) have had a thorough test of a large base of existing ST
software to see if it worked on the Falcon 030, and they found that 95% (no
kiddin', ninty-five%) do run!
This is even better than what Atari self hoped for, and it is MUCH better
than what the TT can show up with. I have a TT and have little problems to
get the software I need.

Yeah... There's a small problem with that though... Atari said to all the magazine publishers that the Falcon wasn't particularly supposed to be compatible with the STe, so that's what their writing. The games press are saying that the A1200 is better 'cause 60% of standard Amiga stuff (exactly what that means I'm not sure) will run.

A good bit to get people flaming is...

With regard to A500 games...

60% of A600 stuff runs on the A1200
80% of A500+ stuff runs on the A600
50% of A500 stuff runs on the A500+.

Which in total isn't a particularly good compatibility rating!

> This works _every time_ on my TT, and at least one other that I know of.

According to Dave Small, on GEnie, you should not need to format
a double density floppy, but you do need to access one. According
to Dave this causes TOS to set the floppy controller to the required
density. Just thought I'd pass this along. However I can not confirm
this as I own Spectre 128 not GCR.

The Cleveland Free-Net Atari SIG is looking for a ST/Falcon030 programmer
and developer.

The main responsibility of yours would be the "16/32-bit Programming/Developing
Area" in the Atari SIG.

You would make it a good place for programmers and developers to obtain
information and have useful discussions.

Please be aware that this position may require 10 hours a week IF the
area gets busy enough. Also, it will take some time for you to reorganize
the area so that it becomes a place where programmers and developers
will want to go.

This is a non-paying position. All sysops are volunteers on the Cleveland
Free-Net.

The Cleveland Free-Net Atari SIG is also looking for an Atari News SysOp.

If you are interested in all types of news, rumors, tidbits related to
Atari Corporation and the Atari Community, this is a position for you!

You'll have a reason to find the latest info! And you will also be helping
to deliver this information to other Atari users.

We already have a sysop that posts online magazines WEEKLY, so you will
not have to worry about this.

The Cleveland Free-Net Atari SIG continues to make efforts to be the
ultimate FREE source of Atari information and conversation!

If you want to help and feel you have the time, please leave e-mail.

Thanks!

Atari SIG (xx004@cleveland.Freenet.Edu)

Len Stys

I just read the transcript from FRIDAY's RTC on GEnie (With Bob Brodie).

He said the sub-contractor has not been meeting the Q/A or production requirements.

"The number of the machines coming from this factory that have fail diagnostic tests is completely unacceptable to Sam. He is _angry_ about this, as producing Atari Falcon030s is a paramount importance to us."

He said there was going to be a meeting this monday with the factory do discuss the problems.

He is meeting with other sub-contractors so the can produce the FALCON030's in parallel with the "failing" factory.

Because of this, don't expect significant shipments until MARCH when the planned mass advertising campaign is suppost to be launched.

There are about 19 different mags which are suppose to have announcement and or reviews about the Falcon030. they include:

Appplied Techniques - Business week - Byte - CNN - Computer Retail Week - Computer Technology - Computing NOW (sounds like a radical feminist group ;^>) - Datamation - Design News - E. Q. Magazine - EDN NEWS - Eyecom Magazine - Keyboard (of course!) - Motorola DSP News letter - MultiMedia World - New Media - Newsbytes - Notworthy - PC Laptop Computers - Scientific Computering and Automation - Studio Software report - And "a bunch of others..."

Oh BTW, for the STReport readers:

FCC Approvial number for the Atari Falcon030 is: EBAF030ST - application dated Sept 18, 1992 - granted Nov. 5, 1992.

Get one of the online mags, they will have a full transcript of the confrence....

Do you *really* think it was meant!? Ever heard of sarcasm!?

Almost anyone I know could do a better job of marketing machines than these people - we bought our computers because we like them. (Although people take offense from 'your computer sucks' the same way people say 'your house sucks'.) If the company can't market - that's their own lookout, they go bust, (unlikely), and little else happens. Nothing the average consumer can ever say, or do (less than a smalll bomb) is going to effect the company at all! (Apart from buying/not buying their machines).

> MiNT.

I believe, I read an article in this newsgroup or in c.s.a.s.t that someone already ported oleo. But he did it by adding some code to the MiNT kernel to add some missing signal or so, which was used by oleo.

> I'm looking at it. No long term promises.

> It may be possible to get "sc" running (a non-GNU project spreadsheet).
> I'll check.

With GNU-C and MiNT, this is just a simple compile job. At most a handfull of lines must be changed. I found only one glitch. You have to link with a CURSES/TERMCAP library, which explicitly compiled with the MiNT header files, since SC relies on CURSES to put the terminal into raw mode. With the standard TOS compiled CURSES lib SC wouldn't return to raw mode after a suspend job (^Z).

Hi,

Have you tried letting the countdown go all the way and seeing if it boots? I am not saying that your drive needs the full 90 secs, but I know that my drive (Quantum LPS105) needs 20seconds (according to noroach) - at 10 seconds it boots some of the time, and absolutely will not boot at 0 seconds. Your Conner may just be trying to initialize itself when you try to boot from it.

Hi Netland !!

I am looking for some FAX software to use on my atari st machine,
as I recently got one of these FAX modems (ZyXEL). maybe something
exists in the public domain.

any leads are welcome (also those to commercial products, please
mention the price)

Thanks

Rudi van Drunen

(rudi@igc.ethz.ch)

381. VIPGEM 1.0 to anything else

Newsgroup: comp.sys.atari.st
Date: 1993-01-09 22:52:28 UTC
From: alberto@cs.umd.edu
Message-ID: <ALBERTO.93Jan9175228@jacksun.cs.umd.edu>
Source record: 212421

Hi, I was the one who posted a message about how to get data files out
of the spreadsheet program VIPGEM and into some PC.

Nobody has answer. So I wil try to refrase the question.

Mi friend uses VIPGEM 1.0 (1986). He has lots of files in this format
and now is planning to move on. Here are my questions:

1) Is there any program in the atari able to read file from
this version of VIPGEM and put it in some more contemporary piece of
software?

2) The final end is to transfer this file to the IBMPC [:-(]
environment at his office. Do you know of any spreadshit program that
has compatible versions for both environments ATARI and IMBPC.

3) Is there any chain of software that would make it possible
to transfer software from VIPGEM 1.0 to one of these double
environment programs?

Partial answers are appreciated. Please respond by e-mail and I will
summarize. Please let me know if you have any idea or hint in how to
accomplish this. Beleve it or not you could be one of a very small
group that knkows how to do it.

BTW, if you ever were able to upgrade out of VIPGEM into something
else, I would also like to hear from you.

Thanks in advance.

Jose Alberto.

382. Re: Convince me to stick with Atari.

Newsgroup: comp.sys.atari.st
Date: 1993-01-09 23:32:52 UTC
From: SML108@psuvm.psu.edu
Message-ID: <93009.183252SML108@psuvm.psu.edu>
Source record: 212428

Well I cannot dissuade you from buying a '486 but I can tell you why
I'm never buying a mac...

#1 The software costs WAY too much. Microsoft Word's price is a joke. It's
like you're SUPPOSED to buy it and split the cost between a few friends...
I'd like to run X on whatever computer I buy next. MacX server software
is $300. Get a clue... I believe it is FREE on the PC...

#2 Macs cost too much. Apple charges what people will pay for them. The
uninformed don't realize they're getting ripped relative to the cost of
the components. I'm not totally uninformed... Of course, as magical
wonder tools, computers in general are as amazing a bargain as long-distance
phone calls...

#3 If I'm going to pay a lot for the computer, I want some co-processors.
Sheesh, you can get a used SGI Indigo for ^$6000...

#4 I hate the mac file system. I don't LIKE dos, but at least you can access
any file without fussing around with resource parameters... Ditto for
any form of unix... Are there really any alternative operating systems
for the mac other than I believe $1000 Apple Unix (AUX)?

Like you, I want to buy a Falcon or an Amiga, But I'm waiting. I am afraid
brute force on the PCs will ultimately overtake the design elegance of these
machines. I'll still keep my 1040 though... I just need to get X running
on it and I'll be happy for some time yet. The NCDs in my lab only have
8 Mhz 68000s and they are perfectly adequate X terminals...

Just incidentally, how much is MultiTOS going to cost when it finally
is released (whenever that might be)..?

I know that it will cost me over $140 to upgrade to TOS 2.06 in ROM..

OS/2 is available *NOW* from IBM, on CD-ROM, for $15.00

(Quick.. somebody get David P-Z a glass of water before he chokes..)

Excuse me, who died and made you the morality guard of the world? Your
saying that people who express what they feel have no place on the net
(never mind planet) is just as bad. And on that note, let me assure

you that saying something like that, and actually killling someone
are two different things. If anyone around here doesn't belong on the
net, it's militant, self-righteous anal retentives who not only think
they areright, but take every tiny opportunity to shove it down
everyone else's throats.
In answer to your question, Mike is the former co-owner of AIM,
founder and long-standing officer of the Washtenaw Atari User's Group,
and an Atari dealer.

Yes it's true. However, that $15.00 version of OS/2 is a non-registered
beta version which is only liscensed until January 3, 1993. You wouldn't
want to have a pirated OS would you?

Prism Paint?! The Cyber-Series!? CAD-3D!? Spectrum 512 (a little dated
but it produces nice pictures).. True-Paint (Dunno if it's been released
yet or not).

If people wanted to run MS-Doze software, they would have purchased
a 386, not an STE! Think about it!!

Also - did you know that the ST/E's biggest use, is for music!?
(You may have noticed those MIDI ports on the side 8-) Built in as
standard too!! As well as those Stereo output sockets on the back of
the STE<. And Great software such as Notator, Cu-Base, etc. (Of which
there's been a lot of rights-swapping lately.)

Dogs Crawl under fences.... Software crawls under windows....

> > This, of course, doesn't change the fact that PC operating systems are
> > crap. Use that as your argument to promote the ST.
>
> OS/2 2.x? NeXTstep '486 (when it comes out)?

And what are the minimum system requirements for that!? How much RAM
does it Need!?

The ST's GEM environment is on ROM chips, so is faster, requires under
200k of RAM (not sure about newer versions). And doesn't NEED a Hard
Drive to run!!

The Basic ST, which will run Quite happily on a single-tasking, WIMPS
environment, only has 512k of RAM, a 720k Floppy, and NO Hard-Drive.
It works, and you still have around 350k of RAM free!!

OS/2 and windows are HUGE, and VERY expensive, the ST's operating system
comes built in - you don't have to pay for it! (Okay, the price of
the chips is included of course but you get the idea 8-)

MS-Doze is the standard on IBM clones, and it is VERY under-productive!

M-ROS!? Maybe you mean M-TOS!? (Correct me if I'm wrong).

It's just like GEM (the usualy desktop), except you can run several programs at once, the screen output of which is put into windows instead of drawn to the screen!

(That's *sort of* the basic idea 8-)

I've never seen it myself (apart from a picture). Looks nice, but can't say much more!

I would add a third alternative to Uniterm and Connect - Flash 1.6 (*not* Flash 2). The vt100 emulation is very reliable although not as complete as Uniterm. Uniterm is also the fastest at character drawing for ST term programs that I've seen. Flash 1.6 is almost as fast but has other great features that make it a real workhorse (like that nice editable capture buffer with word wrap, etc.).

Both Uniterm and Flash 1.6 (and maybe Connect, I tried it but can't remember, I deleted it anyway) correctly handle long lines, which you wouldn't believe how many term programs screw up.

I tried ANSI-Term, it rebooted my damn machine every time! What a joke.
I tried the STalker 3.0 Demo, I found 3 or 4 bugs mostly with long lines within 10 minutes, also it was the slowest screen drawing I've ever seen.

I don't like Gem window term programs (like Connect) because they're slow and if I want 24x80 I have to fiddle with GDOS fonts or something and get a crappy looking font. Until Atari makes machines with more than 640x480 res, 24x80 in a window will look like crap.

So for me, Uniterm and Flash 1.6 are the only term programs. I have to try Freeze-dried term, I think that's the only one I haven't tried.
I suspect Storm will be a good one too, although Basic makes me ill. :)

394. Atari ST system 4 sale...

Newsgroup: comp.sys.atari.st
Date: 1993-01-10 05:37:29 UTC
From: aj743@cleveland.Freenet.Edu
Message-ID: <1iocmpINN397@usenet.INS.CWRU.Edu>
Source record: 212441

I have an Atari 520ST system for sale. Every thing is in great condition and has been treated with loving care. I have recently moved on to a new system and would like to find a home for my Atari. I am asking $400.00 or best offer for everything plus shipping. If you have any questions please send E-mail...

HARDWARE:

Atari 520ST
- 68000 16bit CPU at 8MHz
- 512k RAM
- RF modulator for connecting to your TV
- Atari two button mouse
- TOS operating system with GEM graphical user interface
- Two joysticks
- Connector to add two joysticks for four players

Two Atari SF354
- Single sided disk drives
- Uses 3.5" disks
- Will format to 360k

Master 3S
- Double sided disk drive
- Will format to 720k
- Teac mechanism

Rio Datel Disk Drive
- Double sided disk drive
- Will format to 720k
- Teac mechanism

Atari SMM804
- 9 pin printer
- Cable
- Paper

SOFTWARE:

All software is like new and includes manuals...

-APPLICATIONS-

Flash
Shadow
WordPerfect

-GAMES-

Advanced Dungeons & Dragons: Heroes of the Lance
Better Dead Than Alien
Alien Syndrome
Barbarian
Batman: The Caped Crusader
Dungeon Master
Chessmaster 2000
Exolon
Falcon: The F-16 Fighter Simulation
Formula 1 Grand Prix
Gauntlet
Gauntlet II
Hitchhiker's Guide to the Galaxy
King's Quest III
Leader Board
Leather Goddesses of Phobos
Leatherneck
Outrun
Hyperdome
Moon Patrol
The Pawn
Phantasie
Phantasie II
Phantasie III
Test Drive
Star Fleet I: The War Begins
Sundog
Thrust
Starglider
Star Wars
Space Quest
Star Trek: The Rebel Universe
Thunder Blade
Time Bandit
Ultima II
Exodus: Ultima III
Ultima IV: Quest of the Avatar
Plutos
Vectorball
Xevious
Uridium
Robotron: 2084
Warhawk
Wizard's Crown

OTHER:

Lots and lots of Atari ST specific magazines...

Cross-posted to: comp.sys.atari.st,news.groups

I just posted "reverse" to comp.binaries.atari.st. It's the only submission I've received for either group in nearly a month, unless you count all the "Why isn't there anything in this group?" messages.

It seems clear to me that neither group is going to pick up much steam under my direction. When I post the submission guidelines, I get a trickle of new programs, but it dies off quickly.

Originally, this was going to be a simple call for a new moderator, someone who has the time to be a little more proactive about seeking out software to post, which is what I think would be necessary to get any decent volume. But upon further reflection, I started wondering if maybe c.b.a.s (and to a lesser extent c.s.a.s) was really all that useful in its present form.

With the steady increase in popularity of the ftp-based archive sites, many of which can also be accessed directly via E-mail (or indirectly via the various ftpmail servers on the net), does it really make sense any more to broadcast uuencoded binaries to every site on the net?

Perhaps the group should be more along the lines of gnu.announce, where new programs available for ftp (or mail-server access) are announced but not actually posted. This might cut down on what little net bandwidth the group eats; on the other hand, it makes retrieving software on a UUCP-only site slower, sometimes significantly so.

Not, mind you, that I'm opposed to the way the group works now, or to continuing as moderator, but neither of these may be the most effective way to serve the Atari ST user community, which is largely why I got into this moderation thing in the first place.

So what do people think? Should the group continue as is? Should I step down and let someone else take the helm? Should binaries continue to be posted, or should the group switch to a low-bandwidth "announce" format? If it did the latter, would it still be an appropriate member of the comp.binaries hierarchy? And what about comp.sources.atari.st?

I've crossposted to news.groups, as there are some issues of general interest here, but the decision should ultimately be made by the comp.sys.atari.st crowd, I think.

-Steve

396. Re: STalker vs Uniterm?

My opinion is that Flash 1.6 and Uniterm are the only two. See my other post in this group.... I found the STalker 3.0 demo to be very buggy and extremely slow. Uniterm is the fastest, so if you're used to that, STalker will make you laugh out loud. Try Flash 1.6, it's solid as a rock, unless you need very complete vt102 like Uniterm. (even then Flash is pretty good).

> One thing that I would like to know about Stalker is if it will allow
> me to have a 49 line screen like I use in Uniterm... this is essential
> for me (not I have a mono monitor).

You must have better eyes than me. :) Stalker probably lets you use GDOS fonts or something, but it will look like sh*t and be unbearably slow. Uh, Flash 1.6 does 50 line mode also...

Source record: 212446

I'd say that if someone is getting software, the bulk of their software will be directly from the archives, rather than the newsgroup, anyway. So, my recomendation is to delete c.b.a.s and possibly c.s.a.s and create a new moderated group, comp.archives.atari.st, with a FAQ, and new UL's

>
>Prism Paint?! The Cyber-Series!? CAD-3D!? Spectrum 512 (a little dated
>but it produces nice pictures).. True-Paint (Dunno if it's been released
>yet or not).

How about real-time 24-bit video on a Macintosh? You *always* lose
when you play "Can You Top This" games with PC's and Mac's. There's just
more money spent on software in those markets. ST developers couldn't
compete if they tried in today's market. You don't spend $1 million
on a product you're going to sell a couple thousand of.

>If people wanted to run MS-Doze software, they would have purchased
>a 386, not an STE! Think about it!!

I have thought about it, and perhaps I should have done that in the
first place.

>Also - did you know that the ST/E's biggest use, is for music!?

Ha! I laugh in your general direction. You think the ST runs the best
MIDI software nowadays? Look at how many sequencer companies have
balied from the ST market and gone to the Mac and PC markets. As for
the STe, any machine that boasts 8-bit sample playback but only
supports four nonstandard playback speeds (6.25, 12.5, 25, 50 kHz) is a
joke.

>(You may have noticed those MIDI ports on the side 8-)

I've also noticed that since PC's have the amazingly novel ability to
accept cards, I can buy a MIDI card and plug it in, and use it on a
reasonably spritely machine. It's a damn good thing they're built into
the ST, isn't it, otherwise we'd be SOL on that front, wouldn't we?

>And Great software such as Notator, Cu-Base, etc. (Of which
>there's been a lot of rights-swapping lately.)

What NEW software has been written in these categories? I mean, as in
written in 1992. MIDI software is a growing business in the PC and Mac
sectors.

>> OS/2 2.x? NeXTstep '486 (when it comes out)?
>
>And what are the minimum system requirements for that!? How much RAM
>does it Need!?

A losing argument. No one complains that the ST's TOS requires more
than 4K of RAM, but in 1978 it would have been a real problem.
Likewise, one or two megs is no big deal now that SIMM prices are so
low. You will sound sillier with every passing month.

>And doesn't NEED a Hard Drive to run!!

Big deal. Get a hard drive anyway. They're cheap.

>OS/2 and windows are HUGE

Huge by 1985 (ST creation date) standards, maybe. Not by "real OS"
standards. You really have to try using a real OS sometime before you
pass judgement on these things.

>and VERY expensive

That's a GOOD one. $50 is *real* tough to manage for an OS, yeah.

>the ST's operating system
>comes built in - you don't have to pay for it!

Right, and consequently you have to pay $75 to upgrade the OS. That
is, every 3 years when they fix the pending 100 bugs in TOS.

>MS-Doze is the standard on IBM clones, and it is VERY under-productive!

What, exactly, do you DO with your ST that would be so much more
unproductively done on a PC? And in terms of calls, TOS is more
minimal than DOS is. And there IS no CLI for the ST, as far as Atari
is concerned. Only the (snicker) GEM desktop.

Yes there is. In an old Antic magazine there is software and a curcuit
using the XR2211 chip for Fax,Rtty,Morse etc .. I think from memory the
year was about 1987 and June or July rings a bell.

I still have one here in the draw and I used to use it for the Met fax's
distributed in HF and for the weather satellites on 136mhz.

Good luck with the quest

Yes but if you read the message it was not given in this tone!

>
> Almost anyone I know could do a better job of marketing machines than these

Yes well lets see YOU do it here in New Zealand. Now remember they are
doing VERY well with their products (read Lynx) even if it is not the
ST/STE/TT/Falcon range of products. So therefore I say they are doing a
very good marketing job.

Infact in this years 0800 Santa Phone, the ATARI LYNX was the most
requested item for all ages.

Chris you are in for a BIG suprise if you really mean this! Take it from
me. I run OS/2 , Windows and BCD Unix (and the ST) here and OS/2 is the
DOG of the lot. Get Windows NT it is 1000 time better (when it is
released).

Mind you it has taken years for the clone (other pc based OS's) markets
to even catch up with the ST (read all versions) market.

Look at Flash for instance. It was not until ProComm for Windows was
released was there anything like Flash and look how long this has been
around!

Well Atari may not have expanded their machines but the 3rd Party
developers have.

Chris just stop and think of ...

- Spectre
- Sound cards
- Happy (the orginal)
- All the accelerator cards
- Video cards
- Hard disks
- CD cards
- Rom cards/drives
- and the list goes on and on and on and on

Hmm this resembles the same sort of upgrades you get for the PC to me

Completely agreed. Nearly everyone has ftp-access nowadays (right?) so
sending binaries to all the sites is hardly defendable IMO.
Probably the sources-newsgroup can be deleted too -- the occasional sources
that are made available could be sent to c.s.a.st or ...tech Would
raise the S/N level in c.s.a.st at least...
And now we're at it: how about a group comp.sys.atari.flames ??? So we
can get back to the regular interesting stuff in c.s.a.st...

Hi!

Take a look at ftp.tu-clausthal.de (either via anonymous FTP or via email
to mail-server@ftp.tu-clausthal.de)...

anonymous FTP:
ftp ftp.tu-clausthal.de
login "ftp"
password "<your email-address>"
cd /pub/atari/editors
get Index
quit

email:
mail mail-server@ftp.tu-clausthal.de
send /pub/atari/editors/Index
send /pub/atari/Index.complete
end

Bye,
Wolfgang.

416. Preschool software needed for autistic child

Newsgroup: comp.sys.atari.st
Date: 1993-01-10 15:17:31 UTC
From: ers@blaze.cs.jhu.edu
Message-ID: <1993Jan10.151731.5862@blaze.cs.jhu.edu>
Source record: 212508
Cross-posted to: sci.edu,alt.kids-talk,comp.sys.atari.st,misc.education,misc.kids,alt.education.disabled

Does anybody have access to software which can be run on an Atari 1040 ST? I am seeking programs designed for preschoolers which teach the alphabet, beginning reading, word recognition, pre-spelling, beginning spelling, etc. The programs should have good graphics because the friend for whom I am trying to locate this software has an autistic child who does not yet communicate verbally. His parents and teachers believe that he could learn to communicate and read through the use of such computer programs. The family owns an Atari 1040 ST, but has been unable to locate software for it. If you have any, or know where it can be obtained, please contact me.

Please reply by e-mail as I do not regularly read these newsgroups.

Thank you!

-Ed Scheinerman (ers@cs.jhu.edu)

>
NOT to start a flame war here, but a note on math.

since 50% of the games run on a 500+ and only 80% of those run on a 600 and
of those only 60% run on the 1200. Now, I don't know about you but if you pump
it out, lets use an aribtrary number like 100 ok?(NOTE I know there are more
than 100 programs available for the Amiga.)

50% of 100 is 50.
80% of 50 is 40.
60% of 40 is 24!

So 24 out of 100 games should work on the 1200. Personally, I don't find
this all to comforting, especially considering the shape that the world is in
today. Are you going to spend that much money on a system that only can use
less than a quarter of the available programs for it? see 24/100.

Steve Grimm asks what's to become of comp.[sources binaries].atari.st. I would suggest that it would be appropriate to supplement traffic from direct submissions with selections from the ftp archives which are of general interest, even if they were not submitted.

First: I will take it as given that a small minority of those interested in the sources and binaries can ftp directly. In at least the case of atari.archive.umich.edu, but I think others, dialup access to the archive (either to a uucp login or a bbs) has been rejected (mostly, I think, for security reasons). The assumption is common that mailservers and ftp-by-mail are good solutions for the great un-Internetted masses. Here's my other view:

In the Chicago area, mail goes mostly through the heavily-burdened clout system. ftp-by-mail is a strain on the capacity of mail channels (which are administered more with a view to improving speed and reliability of delivery than to accomodating more volume). News travels in several ways that are not open to mail (including a direct satellite downlink to chinet). The goals are more attuned to guaranteed eventual delivery and accomodating volume than with the mail channels. In the Chicago area, a modest switch of volume from news to mail would be a move in a good direction.

I presume that the key to this situation: news has more routes available than mail has, applies in many cases. So I think it would be a good idea, when there are few submissions to the sources/binaries newsgroups, for the moderator to select a reasonable volume of items of wide interest from ftp-only archives and post them.

WHAT interesting stuff? Talking about all the great new software for Atari computers, I suppose? The only thing I've seen here in the past year -- besides disussion about why Atari sucks -- is talk about the Falcon, which you can't even come close to buying in most parts of the world. Those of you who CHOOSE to stay in a market dominated by the World's Worst Company shouldn't complain when people point out Atari's inadequacies. After all, YOU own an ST/TT/Falcon because it does what YOU want, not because of what other people think about, right? It's really NOT a religion, right?

(Followups to c.s.a.flames. :)

BTW, if you want a new group, read news.announce.newgroups and learn about the hideously annoying (and flame-prone) process you have to go through before you can create it. If you're going to try, I suggest you call the new group comp.sys.atari.advocacy to match the amiga and mac groups.

This is getting silly.
C= itself claims 60% compatability with ALL software for the Amiga series.

If your Falcon does 95% then I'm tempted to suggest that you come from another planet. I'm not saying that it is impossible, but I have a hard time accepting it.
Most problems comes from the fact that
- self-modyfying code blows up with caches (turn them off)
- the stack frame is different (no hope for these shitty programmers)
- it runs faster and timing depending on the processor speed blows up. This is especially bad on custom loaders (more shitty programmers)

A very big number of Amiga games have been done on the ST by the same programmers so you'll have your share of crashing games.

Programs that use the OS give the OS writers a chance to help them even if they screw up in some way. Of course, some are beyond all hope.

>If it did the latter, would it still be an appropriate member of the
>comp.binaries hierarchy? And what about comp.sources.atari.st?

I have thought for a while that a place to announce new software releases would be very useful. Many times I've not been aware of the latest versions of software. I had to ask Michael Bernards himself what the latest English version of Rufus was, and I had to get it from Bob Brodie via the F-Net! The same is true with commercial software. For example, I always try to get the latest version of Warp9 when it comes out. It was over 2 months before I knew that the ExtendoSave version had been released! So what might be a good idea is to open the newsgroups to discussion of the latest software, of all varieties. When anyone finds a newly released title, they can post about it, tell where they can FTP it from, and, if people want them to, they could even uuencode it and post it, or post its source code. Something like this wouldn't cut back on the purpose the groups currently serve, while adding something that could benefit a lot of users.

Just my thoughts...

>
> It is sad Atari can not deliver the Falcon on time ...
>i have some things to say
>1) I would have bought a Falcon ....
>2) I still might ....

As time goes on and Atari isn't delivering Falcons, they are losing more
and more customers simply because the computer's technology is becoming
obsolete. If Atari really wanted an edge, they needed to deliver the F30
in October, 1992. That time has past.

>3) It is unfortunate that they were failed by thier sub contractor ...

It is even more UNFORTUNATE that Atari once again decided to ignore common
business practices such as not putting all your eggs in one basket.

I ___HOPE___ that there wasn't only one factory. I'm hoping that there
were at least three and only one factory is having problems.

>4) They should have a conference on genie .... to fill us in ...

Are you kidding? We would only be angered to hear about the continued
problems that Atari has been having.

>5) This revelation of machine delays and factory mess ups
>though not surprising is outrageous ....
>

Oh, if someone asked me to list the top 10 reasons why the Falcon030s
are last six months, that would be one of them. No surprise.

>i am sad i want my Falcon and Multitos ..

If there aren't 50,000 machines sold by next month, I doubt I'll buy one.

In talking about how great the ST is in the MIDI market, the writer also mentioned there's been a lot of rights-swapping for the MIDI software. That's precisely because Atari has allowed this market to get into this horribly bad state. Large companies with, say, 5 full time employees, couldn't make enough money in the ST market anymore to pay for those employees, so they moved on. The authors of the software then took back the rights for the ST version, and are now marketing it out of their garages.

Look at the trends, people. Companies can't make enough to support themselves on single products anymore, and they've done two things to stay alive: Add other products (for example CodeHeads) or branch out into other markets. I heard recently that ISD is making a version of Calamus for Windows. Charles and John have made no secret about the fact that CodeHead Software used to bring in more money handling only 1 program than they do now carrying over 10.

Atari is not currently producing much product to sell. Their stock is barely staying above a dollar.

Atari has approximately $50 million cash and 50 million shares of stock. (From a stockholder's viewpoint, the stock is worth about an eighth of a dollar (12.5 cents) per share. Last time I checked the stock was trading at 1 and 1/8th.) Atari has sold off most of its real estate holdings and other properties. The Lynx was their largest selling product, and their largest account for that, Toys R US, has dropped them.

Atari management should consider renaming their new computer the Millennium Falcon and change their slogan from "Power without the Price!" to "Guaranteed out by the year 2000!"

At least they're giving out multitos NOW... I almost feel sorry for them at this point. Unless Jack does something really drastic, maybe we really ARE seeing the end of Atari... But then again, I've been at this stage before and they have survived... We shall see...

Scott

Um...you would like to dedicate a newsgroup to a subject which will have
"new software releases for the Atari ST" as its subject matter??? That
doesn't make any sense since the traffic, at best, would be a couple of
messages a month. It would seem to make more sense to create a mailing
list instead or just include that information in comp.sys.atari.st.
I think you would have a hard time getting a new group approved, much
as the CPM users would have trouble getting comp.os.cpm.new.software
approved. There just isn't enough traffic/readers/interest to justify
tens of thousands of machines having to carry/propagate the group.

Out of habit, I still look at the ST sections of stores (a VERY
rare thing) and I cannot remember the last time I saw a new
piece of commercial software. However, that may be because there
are so few stores selling the products. I am located in Manhattan,
the center of the largest city in the home country of Atari Corporation
and I cannot think of one store that supports the ST. There are a
few stores, mostly music stores, that sell midi software and one
or two stores that have dusty old stock of ST games, but that is it.
If it wasn't for this newsgroup, and the Atari Lynx, I would have
thought Atari products had disappeared long ago. You simply cannot
find them unless you turn over every rock for a 1000 mile radius.
I can understand the people in Germany still having a soft spot
for Atari since they get a lot of 3rd party support, but it simply
boggles the mind to see Americans/Canadians continue to cheerlead.

Skoal,

Chris

Binaries are no longer of great use, at least not having a specific
group for them. Maybe just dropping the group, and if there is anything
of *great* importance, send it through comp.sys.atari.st or post
it on an FTP site (probably atari.archive.umich.edu) and inform everyone
of where it is!
```

90% of the binaries seemed to end up on FTP sites, (or came from them
to start with), so call is not really too greatTNW���

Problem: It's not STE compatible!! (At least, none of the STE owners
over here have made it work).

Use Ultra-Pack if you are going to do something like that, as it compresses
the data a LOT better than Magic-Shadow!

Or try & locate the macig shadow (version 1.31 or something), that has
a better compression in it (put in by a third party....).

Chaos would be the best one, if it worked on the STE!

I've used my MIDI ports about three times in the past seven years...

> Dogs Crawl under fences.... Software crawls under windows....

Which is _exactly_ why I'm looking into OS/2... I'm not one of the
ignorant masses, I know better.

You're kidding me, aren't you? I use Win 3.1 at work all day, and it's only bearable because I've got a '486/33 with 8M of RAM. OS/2's features/specs look MUCH nicer to me than NT ("Needs Terrabytes"). NT's market will be businesses that need better networking... what it offers (and what it takes to run it) pretty much rule it out for the "typical" home user.

Win NT's beta needs 30-60M of disk space, and 12M or RAM. Without those resources, it's worse than Windows 3.0 an a '386sx (I've been reading a few OS/2 newsgroups and the Windows groups).

Also, I'd rather stick with my ST than use any software from Microsoft.

> Chris you are in for a BIG suprise if you really mean this! Take it from

What are you running OS/2 on? Are you using the good filesystem, or the DOS filesystem? Your biases are showing if you expect me to think that OS/2 is slower than your ST system...

> Mind you it has taken years for the clone (other pc based OS's) markets

I don't think you're looking in the right places for your software...

> Look at Flash for instance. It was not until ProComm for Windows was
> released was there anything like Flash and look how long this has been
> around!

Flash is a piece of junk... even Alan Page (the author) says that. Uniterm is _free_ and much better. STalker is commercial and much better. The terminal program that comes with Windoze is much worse, but what should you expect from the makers of DOS?

If you look hard, you can find an ST ftp site to get software from. If you look hard through any of the zillion Mac/PC ftp sites, you can find the good software.

All excellent points... Another one is the absurd cost of peripherals.
Compare the price of a SyQuest or something with a comparable drive on a
PC, even an external one with its own case/powersupply.

> Like you, I want to buy a Falcon or an Amiga, But I'm waiting. I am afraid

I've looked and decided Macs are far too expensive for what you get.
Also, you end up with better hardware (surprise!) and software that's
about as good (anybody use Microsoft Word lately? I hate MS, but Word
is kinda nice...).

I think X on an ST is pretty much a pipe dream... Sure it's possible,
but who's going to develop it? Used Suns are pretty cheap, and if you
need unix/X, why not get the real thing?

Ah, but I'd like to hear other people's opinions... Maybe I've missed
out on something great, maybe I'm barking up the wrong tree. There are
also a _lot_ of people around here who's "tarnished" themselves by
buying other systems... I'd like to hear about their problems/successes
with their new systems.

The only weapon we have against salesdroids is knowledge. You can bet
that no matter what I decide to go with, I'm going to know more about it
than the person trying to sell it to me.

Well, like I've said in several posts, I might've missed something
better, or I might be barking up the wrong tree, or I might (shudder!)
be trying to gather as much information as possible before I even start
to move to another platform.

> Many of us are in the same boat as you but STill love our Atari computers
> and will do anything to see them here in the years to come. Unlike
> yourself if the tones of your previous poSTs are anything to go by.

Hmm, so I'm not at all optimistic about Atari's chances of success...
Your point?

> So in conclusion, think not what Atari can do for Chris but what has
> Chris done for Atari (BIG GRIN-)

Hmm, check the FAQ for my name. Do a search on the GEnie file libraries
for C.HERBORTH. I've also helped innumberable people find
software/learn to use software/etc on their STs.

For Atari, I've bought their system (and two monitors). For the
developers, I've bought things from Timeworks DTP to MaxiFile III to
Dungeon Master.

It's amazing how easily some of the people here leap into defensive mode
when you start to suggest that maybe, just _maybe_, there might be
something better than Atari. Right now, I happen to think OS/2 might be
it, and I'm trying to get as many first-hand opinions as possible.

Well, from what I've heard, OS/2 and Windows both need the RAM/hard drive space that is standard in every PC sold these days... 4M RAM, an 80M hard drive. They both work better with more RAM/disk.

> The ST's GEM environment is on ROM chips, so is faster, requires under
> 200k of RAM (not sure about newer versions). And doesn't NEED a Hard
> Drive to run!!

So? After buying a hard drive (well, four of them), I'll neer use a computer without one again... why should I? Everything I do is much faster because of them. And MANY things I do would be impossible without them. Can you even _load_ GNU C++ on a "standard" 1M ST?

> OS/2 and windows are HUGE, and VERY expensive, the ST's operating system
> comes built in - you don't have to pay for it! (Okay, the price of
> the chips is included of course but you get the idea 8-)

OS/2 2.1 beta on CD-ROM for $15 apparently... $15 in a $1500-$2000 system isn't exactly noticable...

> MS-Doze is the standard on IBM clones, and it is VERY under-productive!

Which is precisely why I'm looking into the other alternatives. Why is it that EVERYONE assumes DOS when you say PC? As Dave Bagget's pointed out, you can put any one of a HALF-DOZEN or more operating systems on a clone... most of them will co-exist quite nicely, allowing you to quit OS/2 (or Windoze or whatever) and reboot in unix with X.

> years William is correct in what he says!

And, apparently, 90% of the people in comp.sys.atari.st who haven't already left for another platform, don't mind waiting hours for compiles, while they can't do anything else.

Over the past two years, I've been looking at all the things that are available for the other platforms. It's _nice_ to be working on something in a nice word processor, and be able to pop open a CLI window, type a few commands, compile something, etc, switch back to the WP while it continues compiling, load up another program to work on a graphic while everything keeps going, etc etc.

MiNT won't cut it... The ST is much too slow for multitasking. Just try running GNU C over some code in the background with MiNT... Suddenly your 4M is gone and you can't even load ps to see what's going on. The ST wasn't designed for that sort of abuse. MiNT is an _awesome_ thing, to be able to multitask effectively on this sort of hardware.

How many of those can you plug in at once? How much choice do you have
if you need one of them? If you were using a PC or Mac, you've have
several to choose from... you could (gasp!) pick the best one for the
amount of money you want to spend. On the ST, you pick the only one,
and pay what they're asking for it.

>you even can use higher baudrates then 19200 (eg 38400 or 57600).
>There exists and english version but no english documentaion so far.

I hate Terminal programs on the ST that only run in a GEM window.
The reason, I need 80 columns. To get 80 columns on the screen with
GEM, you need to use real small characters, and with the ST's poor
screen modes, it's hard on the eyes. (note: i'm using a colour
monitor, not mono)

Therefore to connect to a VAX, I use UNITERM.

Craig.

Yes, that's for the software! But what is the cost for the hardware
requirements? The sodtware/hardware priceratio has been decreasing steadily
for the last years for DOS-machines (IBM-clones), but it's still a bit to high
for me or for the general user IMHO.

>>the ST's operating system
>>comes built in - you don't have to pay for it!

>Right, and consequently you have to pay $75 to upgrade the OS. That

Come on now! Don't tell me there is no bugs in Windows or OS/2? I have used
Windows 3.1, and what is bugging me is when the program-manager crashes
everything else crashes! You are left with a nice, clean desktop with no
icons or windows! Great... As for OS/2 which I have used very little, it has
some bugs too, but is more stable than Windows in my experience. MS/DOS I won't
even discuss.. :)

>>MS-Doze is the standard on IBM clones, and it is VERY under-productive!

Oh, so the GEM desktop is no good as GUI you mean? I find it very nice myself.
It's not cluttered with loads of strange stuff that doesn't belong there,
and btw the filemanager under windows is a joke. I haven't come across anything
as effective and easy to use as the "filemanager" that GEM have. BUT: GEM is
a bit outdated yes, but it's a perfectly good GUI as any.

447. Falcon030 competes with '486dx-33

Newsgroup: comp.sys.atari.st
Date: 1993-01-11 03:57:14 UTC
From: cherborth@semprini.tdkcs.waterloo.on.ca
Message-ID: <H.ea.kXNJs3zV6no@semprini.tdkcs.waterloo.on.ca>
Source record: 212377

Well, I knew the Falcon030 (4M/65M hard drive configuration) was competing with the Mac LC II (4M/80M hard drive) in the ~$1700 range, but check this out... it's also competing with high-quality '486/33 systems!

This is from a Zeos product listing. Zeos is a very high-quality mail order place (1-800 numbers, 30 day no questions asked guarentee, good reputation, etc).

VESA LocalBus system:

'486sx-25
4M RAM (on motherboard; will take up to 64M on the motherboard)
130 MB IDE drive (SCSI/SCSI-II is a $50 option, on the motherboard)
5.25" 1.2M and 3.5" 1.44M floppies
14" hires 1024x768 non-interlaced colour monitor
1MB VRAM VESA LocalBus video card
2 serial ports, 1 parallel port
7 16-bit expansion slots (like the Falcon's "PDS")
1 8-bit expansion slot (bleh; better than the ST's cartridge port)
2 VESA Local Bus slots (one used by the video)
7-bay desktop case (4x 5.25" HH bays; 2x 3.5" 1/3H bays; 1x 3.5" HH bay)
2 cooling fans (hmm, hope it isn't too loud)
high-capacity power supply with built-in surge supression
101-key keyboard
Microsoft Mouse
DOS 5.0/Windows 3.1
Choose two of: Ami Pro (word proccessor extraordinaire),
Lotus 1-2-3 for Windows,
Freelance Graphics (Adobe Freelance?)

Price -> $1895.00

Now, sure, this is more than the projected $1700 for the Falcon, but it includes the monitor (can you buy a 14" colour monitor for $195?), and two high-powered big-name programs.

This is the "new" localbus stuff... VERY fast video. RAM and video access will be as fast as the CPU can do it, since it doesn't have to go through the ISA bus.

"Oh", you say, "but DOS/Windows sucks so badly compared to GEM!" Well, what's to stop you from putting OS/2 on it? Unix?

There's also a 2M/85M '486dx-50 system for $1745, with monochrome monitor and 24-bit Diamond Speedstar graphics card. There's also a '486dx-33 EISA system (4M/107M hard drive) for $1895.

Wasn't Atari's last memorable slogan, "Power without the price!"? A '486sx-25 will _CRUSH_ a 68030-16, no matter what OS you put on it...

Flame me at will, but I think things are looking _very_ bad for Atari. Especially with the recent "factory quality" problems (remember the "waiting for the cover art" problem with FSM-GDOS?) that'll prevent the birds from showing up in North America 'til March. Those LocalBus systems look _real_ nice, and (surprise!) they're expandible.

Anyone know abou the Atari SLM805 Lasre printer? I think it may be an older model (or something) than the SLM605. Anyway, any particulars would be nice.

A friendly warning to all. Everytime that I've used MOS Disk Utilities de-fragmenter on my harddrive (Megafile30), something horrible has happened. I am sitting in front of my ST, looking at a destroyed partition. I'm hatin' life. I didn't even have anything that could interfere with it. I just wanted to warn you all (and give a respite from the anti-Atari and anti-other OS postings)...

<concerning Syquest drives>
>I always boot using a disk with a warmstart program in the AUTO folder
>(and I don't like it).

Several years ago, Tim Purves wrote a program which sold in a package called "Michtron Utilities" that would resolve the first-boot problem with Syquests (and any other SCSI drive which won't auto-boot the first time on powerup.) It was called HARDAUTO. You simply put your hard drive booter software in the AUTO folder on a floppy in drive A:, and then put HARDAUTO in there right behind it. The first time you boot you will still boot from the floppy, but HARDAUTO forces the system to look for AUTO and .ACC files on the harddrive anyway...

There's also a program called SCSIBOOT that will write a bootsector to floppy A: that issues a SCSI wakeup which takes care of the problem. Personally, I don't prefer this method since I'd rather have my VirusKiller Monitor Guard installed on my A: bootsector instead...

For some inexplicable reason, I dont have this problem anymore since I installed a Maxtor 130meg fixed drive along with my Syquest. But I also know people who use only the Syquest, and they don't have the problem at all... Go figure.

>>And doesn't NEED a Hard Drive to run!!
>
> Big deal. Get a hard drive anyway. They're cheap.

Say bud...if they're so cheap, why donl;t you mail me the money order for a new one? I don't happen to have the cash, nor, I would bet, do a lot of other people. I may guess this may be even more so in a smaller, foreign country. I'll keep my eye on the mail and continue to run my software from the RAMdisk so I won't be holding my breath.

>>OS/2 and windows are HUGE

I'm still using very old version of TOS (1.2 I think) and have no plans for spending money to upgrade it. BTW, I see you suddenly got a little tight with the purse-strings....hmm.

>>MS-Doze is the standard on IBM clones, and it is VERY under-productive!

> What, exactly, do you DO with your ST that would be so much more
> unproductively done on a PC? And in terms of calls, TOS is more
> minimal than DOS is. And there IS no CLI for the ST, as far as Atari
> is concerned. Only the (snicker) GEM desktop.

What's the point to trying to get a PC put together the right way to do what I want it to do, for less cost than my MEGA ST4? Too bad more people didn't find out about ST's when I did. There'd probably be less people hell-bent on a hard drive/the latest-greatest 'x86 PC/super-workhorse/more-than-they-need/1000. And I have no qualms with GEM.

Oh well, you and the Jones' have fun competing with each other. I'm gonna see if I can get something done here.

P.S. Why are the only people who actively promote the clones _I know_, the ones who are able to hook up with _pirate copies_ of the hard-drive munching,

processing-time gobbling software they rave about? I reckon a large number of people would sing a different song if they _had_ to play by the rules. Not to mention they wouldn't be able to afford to fill those bulging hard-drives their shiney new system sports.

>want to have a pirated OS would you?

Well, er.. my boss called IBM at the 800 number you provided on
Molin's Den (thanks, Dan..!) last Friday, January 8, 1993, and
IBM sold him a CD-ROM with OS/2 on it.. with nothing said about
it being a beta copy..

They said two week delivery, but unofficially to expect it much
sooner than that... so I guess we'll see when it gets here..

Heck.. at that price, I'm thinking of ordering one too..!

My thoughts to that point (thinking more generally) are that MOST people don't NEED to program in GNU C++. This places a hard-drive back into the nice-but-still-a-luxury catagory. Sorry, it's still $$ (and a maybe a smattering of nostalgia) that holds me out of the clone-realm. I'll probably cross the threshhold some time after a hard-drive for this ST costs more than a complete clone system. And that's not likely to happen soon.

> OS/2 2.1 beta on CD-ROM for $15 apparently... $15 in a $1500-$2000
> system isn't exactly noticable...

I believe someone said something about that being a beta copy, or unliscenced or something. Of course pirating is not so unfamiliar to many clone users.

Anywho, it sounds like you're on the right track. Buy what you need. Use will-power. Buy only what you need. The clone-realm is prone to draw a man to gadget hell. Look at them, look at what Atari can do, look at what MAC can do. Good luck!

>M-ROS!? Maybe you mean M-TOS!? (Correct me if I'm wrong).
I'm afraid you might be..

Maybe he means M-ROS..Which is some sort of program switcher included
in the Cubase package from Steinberg.

Frank, I'm not exactly sure what it does but I think you can have a few
programs in memory at the same time and switch between them, possibly even
run real time midi processors at the same time as your sequence.
I haven't seen the editor.

That is, unfortunately, rather a large stab in the dark. I'm sure someone who
knows _exactly_ what it does will fill you in as I'd like to know too.
I do know, however, that it _HATES_ anything C-LAB so don't load in any
of thier editors!

Cheers,

Greg.

s> parallel port instead?

Yeah, unless they've changed them recently, you can't. It's like with the
pocket harddisks - the PC's parallel port has a pile of extra control lines
that the ST doesn't, and you need these. When I looked at the Xircom
adapter a while ago, it seemed dependant on these extra lines.

s> Personally, I am most interested in a NFS client, as I have just

s>
s> Is this anything more than an old man's wild ideas?

Argh! Ick! I looked at NFS in detail a while ago - the compromises you
have to make to get it to work at all in a PC-size environment are
horrible... but it _could_ be done. The real problem is actually
implementing anything other than a super-low performance TCP/IP stack - if
you do nasty things and minimise your buffering, it's not so bad
implmentation-wise, but your performance will suck.

>shiney new system sports.

Hear hear. I'm currently "on hold" relative to purchasing any more Atari
stuff (should have bought that damn Mega STE last summer instead of deciding to
"wait" for Falcon). On the *hardware* level, I could buy a clone or Mac for
even or less money than a new Atari BUT then the software investment would be
prohibitive (never mind that my printers are useless with a Mac). At least
with a new Atari platform, I can run what software I own without having to
upgrade immediately.

I should mention:

1. I still do not have a hard drive, I just added an outboard floppy
a few months ago, for years I was a single floppy user. Both my 520
and 1040 have no extra memory.

2. I still use 1st Word (not even Plus) because it works for what
WP tasks I have. I did ALL my grad school papers on it plus wrote
a number of magazine articles. The magazine, BTW is published on an
ST.

3. I do not play games on my ST, I do not do my own programming.
I *do* run MIDI applications, do WP, balance my checkbook and maintain
mailing lists for my bands (i'm a semi-pro musician).

4. The one application I would like to add is DTP. I'm holding off
for now but there are certainly acceptable applications today for
the ST, and they are affordable both new or used.

5. I bought almost ALL of my stuff used, since there are no local
dealers but a good user's group near where I live. I bought two CPUs
(a 520 and a 1040), mono monitor and a bunch of SW for total investment
of about $600. The only *new* hardware I have bought was a color tube
(the TV resolution was hampering the kids from using some of their
software).

So it has been a VERY cost effective solution for me, I have no complaints.
Yes, I would like to be able to go to a local dealer and upgrade my system over
time but it's not like my machine has become useless. I am an engineer by
trade and have worked with everything from IBM machines running punch cards to
workstations including CP/M, VMS, UNIX, DOS and Macs. For home use the ST works

great for me which is all that counts, I suppose. But as I said earlier, no more $$ from me unless it's an emergency need or Atari starts showing some life again.

I guess you mean the SLM804. It is also a 300 dpi dumb page printer.
It is connected to the dma bus via a separate controller (the SLMC804).
It prints about 8 pages per minute.

Alas it does not understand postscript or PCL; for most programs
you need some kind of emulator (Diablo 630 emulator is standard,
FX80 emulator is available by DMC), other programs (Calamus for example)
talk directly to the printer. Interfacing the printer yourself
requires knowledge of the dma protocol.

Compared to other printers it is said to be fast for bitmaps.
Calamus prints really fast on it. I guess this is due to the fact
that other printers are connected to the printer port.

As far as I know the SLM804 is not made anymore; the SLM605 is its
successor.

Is this what you wanted to know?

Sorry to hear the "voodoo" failed to work on your machine. The DD floppy
has to be accessed in Atari mode, just prior to launching Spectre.

IMHO too I have never had much luck with Atari software developers.
About three years ago when Prospero 'C' came out it seemed like the
answer to my problems - a decent 'C' compiler with source level
debugging for the Atari! But alas it was not to be, it had several
nasty bugs. I wrote to them a couple of times, even sent examples
of the bugs but nothing. So I threw that compiler away... The moral
seems to be unless you're a big customer you're on your own. If anyone's
found something to the contrary, I'd love to hear it! :-)

Keith.

The same thing happened to me with a Syquest. I originally had it connected with an old Adapted mfm drive, and the Syquest would not boot directly on the first try. When I replaced the mfm drive with a Quanton 52, the Syquest would boot fine (though I immediately moved my C drive to the Quantum, as it booted faster anyway.) I found that ICD's coldboot program was about the quickest way to get started, especially after it was configured to only look for scsi id0 before starting.

I'm not _quite_ sure if it can be done in software; maybe you would
have to set a jumper or exchange the controller ROMs. BTW: Old Macs
have the same problem, so maybe Syquest has a "Mac version" of their
controller firmware.

TOS 2.06 fixed this problem by making at least two read attempts
from each device on the ACSI bus, so that's another possibility
to solve the problem.

: - self-modyfying code blows up with caches (turn them off)
: - the stack frame is different (no hope for these shitty programmers)
: - it runs faster and timing depending on the processor speed blows up. This
: is especially bad on custom loaders (more shitty programmers)

Then again, most games don't use self-modifying code (ok, perhaps some of the games from former demo-coders), the stack frame isn't particularly interesting for games either (Can't think of any serious reason, this should only give vector-bending software a hard time), and the timing won't be so much of a problem either, because 1. most games run in the VBL (so the speed depends on the display frequency), 2. those which don't won't run THAT much faster, since the Falcon is only 4-5 times faster than the ST in the ST modes... :)

: A very big number of Amiga games have been done on the ST by the same
: programmers so you'll have your share of crashing games.

Well... Actually I don't think the old games are so important - except a few good ones (Dungeon Master ...) there isn't anything that will look or feel particularly good after you've seen some real Falcon games...

: Programs that use the OS give the OS writers a chance to help them even if

> I have heard that various problems are known when using Conner HD on TT's,
> so can anyone help me out? Or does anyone have some documentation on this
> Conner HD concerning the meaning of the various jumper settings??

I'm not quite sure but this sounds as if the ICD driver software does
not implement the TT SCSI protocol correctly. (There's only one
driver that does: CBHD for the TT. This driver will be publicly
available RSN, so you may want to test it for your drive. If you
just can't wait, please contact me via me e-mail.) Probably the
Conner driver sends some SCSI messages to the host after start-up,
and the code that I've seen in both AHDI and other third-party
drivers does not understand that.

I need a program, which can read floating-point numbers in
ASCII representation (eg. "0.333\n0.442...") and use them for
plotting functions (the numbers are the function values).
I need to be able to display a 3d-height field (a function
F: [0,1]x[0,1]->R) and a 2d-grid with several functions
plotted at the same time. The output should be a GEM .IMG.
Does anyone know such a program? What about Gnuplot?

Thanks,
Marinos

I'm curious, just what do you mean by shitty programmers? In the real
world do you seriously expect game writers (ie people trying to screw the
maximum performance out of a machine) to worry about their program being
a little incompatible with future generations of chips? Particularly if they
are not even aware of the these new machines etc when the software is written.
Maybe you would prefer it if the games were a little slower or a little less
impressive, but I certainly wouldn't.

Mark (I wonder if that puts me in the shitty programmer class?)

Re my statement and 24/100...

There is a boot up option on the A1200 which disables the extra chips (eg AA etc) and so this apparently increases compatibility dramatically. One of the Amiga magazines got a 40% compatability with old games and 90% for games < 1yr old.

I'll still get a Falcon, but we need to get correct info on the opposition if we want to beat them!

>Atari computers, I suppose? The only thing I've seen here in the past
>year -- besides disussion about why Atari sucks -- is talk about the
>Falcon, which you can't even come close to buying in most parts of the
>world.

Which only supports my point-of-view: that's it's silly at least (annoying
at the most) that so much bandwidth is wasted on either childish flamewars
or discussions (which tend to get flamy too) about a non-existant machine.
The proposal for a flame-group wasn't entirely serious, but I often wonder
if it wouldn't be a good idea indeed... And some time ago someone proposed
a falcon-group -- another not-too-bad idea maybe...
Once there was a time when reading c.s.a.st was fun and interesting -- and
the bad S/N ratio nowadays is _not_ just caused by the lack of interesting
developments for the ST or whatever. I'm afraid the biggest cause of the
current S/N ratio is the continuous stream of pro/con Atari threads -- with
a functional contents of approx 0.00, always repeating the same religious
arguments, etc, etc.

>Those of you who CHOOSE to stay in a market dominated by the
>World's Worst Company shouldn't complain when people point out Atari's
>inadequacies.

In the meantime I think I (and most other c.s.a.st readers) know all about
Atari's inadequacies. There's little use in repeating the same stuff over
and over again. Please, tell me something new.
And another obvious remark: if people really hate Atari that much, why do
they make themselves (and others) tired with writing articles in this
group? I myself absolutely don't feel the need to write articles on the
shortcomings of PCs in one of the ms-dos group -- why is that? Am I just
being stoopid? Should I write old-stuff-containing, contentsless articles
to the Amiga, IBM, ms-dos, Unix,... groups everyday? C'me on...
OTOH, writing articles on 'how good Atari is' in an Atari-group is of course
as stupid as the reverse...

>After all, YOU own an ST/TT/Falcon because it does what
>YOU want, not because of what other people think about, right? It's
>really NOT a religion, right?

Yes, indeed, I'm not interested whatsoever in what anyone thinks about Atari.
That's why I'd like to see some threads moved, aborted, killed, stopped.
And please, don't yell that much. There's nothing wrong with my eyes or ears.

>BTW, if you want a new group, read news.announce.newgroups and learn
>about the hideously annoying (and flame-prone) process you have to go
>through before you can create it.

I know all about it -- that's why I'm not running a RFD or CFV (sp?)...

From: rasas@minyos.xx.rmit.oz.au
Message-ID: <1is074INNig2@escargot.xx.rmit.OZ.AU>
Source record: 212369

The subject line says it all really. I have found some src (eg tip
for MiNT by Howard Chu and some Un*x stuff) but it always seems to
rely on some struct (like the one defined in xbios.h (?) which isn't
included in the new sozo mint include stuff).

I'm sorry if this is a stupid question but I'm new to programming
and I don't really have much documention.

Also, is there new docs for the mint dlibs or is it a case of 'use the
source'?

Many thanks,

Greg.

>I'll keep my eye on the mail and continue to run my software from the RAMdisk
>so I won't be holding my breath.

Beggars can't be choosers. If you have no money, you really can't
afford to decide between computers, now, can you? That's my point.
The only previous reason to buy a new Atari system was "Power without
the Price." (Snicker.) These days, of course, as we all know from
having paid careful attention to the mail order prices for clones
posted here over the past two months, clones are the cheapest machines
available. Therefore, for people in your situation, the choice is
clear.

>> That's a GOOD one. $50 is *real* tough to manage for an OS, yeah.
>
>Up the amount of the money order, please.

If you can't afford to buy any software at all, then you shouldn't have
bought the computer in the first place. Do you simply pirate all the
software you want? Buying a $1000 machine and then saying you don't
have $50 for a software pacakge is like buying a Ferrari but then not
being able to cough up money for wiper blades.

>> Right, and consequently you have to pay $75 to upgrade the OS. That
>> is, every 3 years when they fix the pending 100 bugs in TOS.
>
>I'm still using very old version of TOS (1.2 I think) and have no plans for
>spending money to upgrade it. BTW, I see you suddenly got a little tight with
>the purse-strings....hmm.

It's not the money, it's the inconvenience, mainly. If you still use
TOS 1.2, watch out for bugs. Since I use(d) my Atari for serious
programming that taxed the machine, I was forced to upgrade to 1.4.
I had to go to a dealer and buy the chipset (once they got them in).
Isn't compeltely obvious that it wouldn't have been much easier and
cheaper to provide OS updates on disk?

(BTW, just because I say you should be able to afford wiper blades
for you Ferrari doesn't mean I advocate spending 10 times as much

as is required for the wiper blades!)

>What's the point to trying to get a PC put together the right way to do what

>need/1000. And I have no qualms with GEM.

Well, you're satisfied with mediocrity then. Once you have a hard
drive and a faster machine, you'll never believe you WASTED so much
time waiting for things to happen. Computers are STILL not fast enough
so that everything I want to do is instantaneous; therefore, I will
always be trying to get faster machines. Time spent waiting for a
compile, unarchive, etc. is time WASTED, especialy under GEM where you
can only run one process at once. At least under Unix or OS/2 you can
edit a docuemnt or fix more bugs in your program while you're waiting.

>Oh well, you and the Jones' have fun competing with each other. I'm gonna see
>if I can get something done here.

Again, I hope you're happy being less productive than you could be.
I'm not.

You know the wrong people?

>I reckon a large number of people would sing a different song if they
>_had_ to play by the rules. Not to mention they wouldn't be able to
>afford to fill those bulging hard-drives their shiney new system
>sports.

The main thing I spend time with nowadays on my PC is TADS 2, which is
shareware and registered, thank you. (And yes, I did buy my copy of
Microsoft C, which was $139, and Ultima Underworld, which was $50.)

I suppose the *computer* is still in a nice-but-still-a-luxury
category, eh? Pencil and paper works JUST FINE, provided you're
willing to wait. Such reactionary arugments are ridiculous. We're not
talking about cutting edge stuff here; hard drives have ben standard
for years now.

>I believe someone said something about that being a beta copy, or unliscenced
>or something. Of course pirating is not so unfamiliar to many clone users.

Frankly, your generalizations only make it obvious that you'll find any
excuse to criticize people who own clones or (gasp) just like them. I
KNOW how cheap ST people are from painful personal experience, so don't
talk to me about piracy, not paying for shareware, etc. YOU are part
of the reason the ST market sucks so much I have to leave it
completely. YOU are the one who says, "I can't pay $50 for OS
software." PC people pay for software in enough numbers that they
support massive development efforts. Both good and bad software comes
out of these, but the market is certainly strong.

>Anywho, it sounds like you're on the right track. Buy what you need.
>Use will-power. Buy only what you need. The clone-realm is prone to
>draw a man to gadget hell. Look at them, look at what Atari can do,
>look at what MAC can do.

Atari's simply aren't competetive anymore. Face it, if you bought a
new machine, would it be an ST? If so, then you really are deluded
beyond all hope. Apple's soon not going to even HAVE a 68000 machine
in their line -- they're just too darn slow by today's standards.

If you turn off WP(word processing) mode - i.e. click on WP mode in the
menu so that the tick dissapears - then 1st Word Plus will save pure
ACSII files. However, Tempus,7UP and Everest are very good ASCII editors,
the last 2 are shareware and can be found on any good BBS.

Source record: 212374

The Spectrum 512 art package was on the Coverdisk of ST Format last year but the instructions they had were not very substantial and did not cover gradient filling as demonstrated in a folder on the disk.

Does anybody know how to do gradient filling in Spectrum 512? Is there any other features of the program ST Format ignored which would be useful?

Replies will be most welcome. Cheerio!

I don't need G++ either. However, I couldn't do any of my project work at
home without GCC. For example, the code I wrote last year compiled perfectly
happily using GCC on a SPARCstation. When I took it home to work on, I tried
all 3 compilers which I had available.

1. Lattice C.
Got around the problem of it not having a proper make by merging all the
files into one. Finally compiled after a few options had been changed.
Code ran and exited immediately, saying that the stack was full.

2. Sozobon C.
Didn't even compile. Got half-way through and said that there was a fatal
bug IN THE COMPILER.

3. GCC.
Worked first time.

Boy is GCC useful. It eats up a few acres of disk space, but I'm glad I've
got it.

The Spectre GCR is a Mac Plus emulator. It doesn't matter if you plug it into an 8MHz ST, a 32MHz TT or a 16MHz Falcon 030... it's still a Mac Plus that just runs at different speeds. To emulate the LCII or any other color Mac, Dave will have to do some serious code overhauling plus the user will have to pick up a set of Mac 512K ROMs. I imagine he will do it. The question is when. :)

Source record: 212383

Hello. I administer an anonymous ftp site (avalon.chinalake.navy.mil) which specializes in 3D objects and related files. I was wondering if anyone out there has the file specs for the .3d2 files which Tom Hudson's CAD-3D uses to save objects in. I know they were in the CAD-3D manual, but unfortunately, all my ST manuals are in storage far from where I sit now. If somebody has these specs in electronic form, I'd appreciate it if they could either email it to me and/or ftp it to the anon server so other people can begin working on converting .3d2 objects to other formats.

Please, respond my email only, as I no longer follow this newsgroup. Thanks in advance...

Hey, post the number... I'll order one (what's $15 on your credit card?), and maybe a few other people would like to check it out... It's not like Atari's going to release a MultiTOS CD-ROM for $15 any time soon.

fyi...
I have tried a few terminal programs under beta releases of MultiTOS.

Flash 1.6 was totally unusable. It looked as if Flash was trying to directly access the hardware, and thus ended up competing for characters with the serial port driver in MultiTOS. On average, there was only about a 50% chance of getting a character you typed echoed back from the port.

"Freeze Dried Terminal" (I forget what version) showed exactly the same symptoms.

Interlink worked in so far as sending/receiving characters went, but it was obvious it didn't handle screen redraws correctly. The presence of windows from other running programs and from the desktop trashed Interlinks dialog buffers/windows.

Stalker 3.0 was rock solid. In addition I haven't noticed any speed "problem" with it.

Copy protection is the big sinner here.

> the stack frame isn't particularly
>interesting for games either (Can't think of any serious reason, this
>should only give vector-bending software a hard time),

If you change return address in an interrupt you get problems (basically doing a sort of multitasking; switching from one part of the code to another. I think I have heard SWIV being an example of this).

> and the timing
>won't be so much of a problem either, because 1. most games run in the
>VBL (so the speed depends on the display frequency), 2. those which don't
>won't run THAT much faster, since the Falcon is only 4-5 times faster
>than the ST in the ST modes... :)

Here I was talking about custom loaders that do something like:
move.w #3000,d0
wait dbra d0,wait

when they wait for the floppy to go from track to track or something else that needs a delay.

>Well... Actually I don't think the old games are so important - except
>a few good ones (Dungeon Master ...) there isn't anything that will
>look or feel particularly good after you've seen some real Falcon games...

If we can throw away the oldest games then the compatability percent jumps up.

Well, _I_ program in GNU C++ (ok, so I'm just learning...), and _I_ do
rendering, and _I_ do DTP... and I'm getting flamed by some of the
other posters for daring to suggest the ST might not be up to snuff for
what I do.

BTW, check out misc.forsale.computers for used hard drive prices. I
bought a 50M Quantum for $80 a few months ago...

> I believe someone said something about that being a beta copy, or unliscenced
> or something. Of course pirating is not so unfamiliar to many clone users.

How exactly does one pirate a CD-ROM? 650M hard drives aren't exactly
cheap... ;-)

From what I've read, it's a beta of OS/2 2.1... MS sold millions of
copies of the Windows 3.1 beta (Windows 3.0, remember that one?)...

> Anywho, it sounds like you're on the right track. Buy what you need. Use

>anyway, I'd rather do it with _quality_ software with a decent
>interface. Right now, a '486 system with OS/2 on it is looking _very_,
>_very_ attractive.

Try looking for a '486 system from a company which offers at least 2 years parts and service warranty. Because you didn't mention a price range, and also because you mentioned the Apple Macintosh IIci in your posting, I would expect you have somewhere in the neighborhood of $2500-$4000 to spend on the machine.

Invest in at least 500 megabytes for a hard drive, and tape backup system. If you get interested in one of the desktop UNIX environments, you'll find that it eats up large chunks of your hard drive. Without a tape backup (look for a SCSI 4 mm DAT device, or the more 'standard' 8mm tape devices), you're going to find yourself frustrated at least once when it is of major importance to have a backup. A CDROM drive is also becoming 'standard equipment'. Be sure the one you get can handle the KODAK CDROM disks.

Don't stint on the monitor purchase. While there are plenty of cheap VGA monitors around, expect to pay around $800 for a good, multiply-synced monitor. The 17" CTX Proscan we have works well at the higher screen densities, and has the advantage of being pluggable into a IIsi (non-synced, of course). The reason I emphasize the monitor is that you mentioned a desire to do a bit of animation and graphics rendering. You can have the fastest CPU on earth and the graphics will still be terrible if you purchased a cheapo superVGA card and nominal monitor.

I'm not going to mention Atari at all. You appear to feel that the company is a 'sinking ship'. With such an attitude (and it may very well be the correct one), you're always going to feel 'cheated' if you purchase a new Atari machine, regardless of how good or well-suited they may be to your applications.

Howdy ST Gamers...

I downloaded oxyd.lzh over the weekend & can't get it to do a whole lot. It throws up screen 1, then this little propellor/flower-looking thing drops down on my little icon (a cannonball, it looks like) and smashes it all to hell. When I try to move (via the mouse), my icon moves a little bit, then gets smashed by the propellor thing anyway. I die almost instantaneously, three times in a row, then the game ends.

What am I doing wrong?

Thanks!
John

Well, I've spent a while sloshing through 200+ posts to comp.sys.atari.st over the weekend. Rather than reply to each and every posting with which I have a minor disagreement, I thought I'd just write one note. You needn't respond unless you really feel the urge.

To Bob R. - I find your announcement of a $15 OS/2 CD-ROM interesting. Unfortunately, I do not have a CD-ROM drive connected to my Mega ST, so I was wondering if you could try using it on YOUR CD-ROM under PC Ditto and let me know how it works out. Heck, I might even save up some money for a new CD-ROM if your report is glowing. It's helpful hints like these that make your postings to this newsgroup such interesting reading.

To Dave B. - Chill out. You're becoming positively rabid in your posts to well-meaning Atari ST users. I did find your posting on ST Picture Formats a refreshing change from the usual "you suck eggs" style that has become a favorite of yours. Remember, all the good things you've done for Atari ST users won't mean a thing when your gone; you'll be remembered as "That guy who hated anyone who liked the Atari ST".

As for those psychopaths out there who think that a few deaths are in order for the Tramiel family (you know who you are), get a life. When you get so obsessed by inanimate electronics products that you'd even jokingly wish doom and disaster on the people who own the company that produces those products, you need to reassess your value system. Or, perhaps, you need to engage in some consensual sexual activities. Maybe both.

For the rest of you out there -- do you read magazines? Newspapers? Listen to the radio? Belong to an ST-oriented user group? Are you interested in increasing the amount of useful information which passes through this newsgroup? Consider the self-appointed job of Atari factfinder (not a registered trademark, yet). When you see new software announced, let us know about it here. When you hear something of interest (and I *don't* mean stock quotes) about the ST, write about it. If you've discovered the perfect program to do X, write about it. One of the hardest jobs I've had in our user group was that of newsletter editor. Too many people sit back an wait for the other person to write about "How I accomplished ..." You can make this a more useful place, and you don't have to be too technical (save technical stuff for postings in comp.sys.atari.st.tech).

You can regain a measure of control of this newsgroup, or you can let it become a source of personal pleasure for folks like Chris Mauritz, who don't even OWN an ST anymore; they just leave messages for the pure joy in watching you squirm.

- DPZ

>I tried ftping to wuarchive and got the same message, so I guess it
>is a true "mirror" of atari.archive :-(

Almost all of the major FTP sites are limiting connections these days. I was suprised to find that wuarchive set limits at 60 connections at any one time ... this was a few weeks back. The U.S. hour limitations for the atari.archive site were imposed recently as well.

It's not uncommon. Even the major Windows FTP site (ftp.cica.indiana.edu for those who don't already know) limits the number of concurrent connections.

As the Internet expands, such limitations are increasing.

518. Re: Spectre & TT

Newsgroup: comp.sys.atari.st
Date: 1993-01-11 20:37:40 UTC
From: paul@jupiter.ame.arizona.edu
Message-ID: <1993Jan11.133742.4234@arizona.edu>
Source record: 212400

I've been away for a few weeks, so this is my first chance to respond to all this....

I run Spectre GCR 3.0 on a TT with TOS 3.05.

The 3.0 manual states that it works on a high-rez _Atari_ monitor, but I've never seen it done.

Spectre does not recognize the internal or external SCSI port on the TT. This is stated somewhere in a manual or in one of the README files. I have my internal hard drive hooked up to the external ASCI port using an ICD Mico host adapter, with the ribbon cable running through the case (I'm sure I'm violating all kinds of FCC rules--my TV goes nuts whenever my hard drive is accessed). I got the connections from the ribbon cable to the D-connector from ICD. I generally have no problems with the setup, and I'm using the disk for both Atari and Mac files.

I can read/write 800K Mac disks just fine. But in order to do this I have to have a floppy in the drive when I turn the computer on, then remove it before launching Spectre. Otherwise it eats floppies for breakfast. And light-off programs won't work. I can format/read/write on either Spectre or a real Mac, though formats on real Macs tend to be somewhat more reliable.

I use the Transverter program that came with Spectre to move file Atari<--> Mac all the time, with either floppy or hard drive. The only thing is that the Mac disk/partition must be in MHF (or whatever--the older one) format.

I hope this helps.

Message-ID: <C0pKJ8.ACq@dscomsa.desy.de>
Source record: 212394
Cross-posted to: rec.music.makers,comp.sys.atari.st,rec.music.synth

Hi

i have heard in musicians press in UK etc that C-Lab Notator (current version v3.15) is
NOT falcon compatible. The review I read stated that it hung just before the main screen
appears.

Also, Evenlode, who are mainly known for distributing Steinberg products, are advertising Notator as NOT Falcon030 compatible, wheras Cubase 3.0 apparently is.

Anyone got any hard facts, or even pure speculation. I don't really want to buy Cubase,
especially as I probably won't be able to get much for my Notator now anyway... If
anything I'd upgrade to Mac plus Notator Logic (but will have to make some dosh first...).

Does the change from C-lab -> Emagic mean Notator will no lonmger be supported???

>Does anyone know such a program? What about Gnuplot?

I believe the ST port of Gnuplot does everything you mention, except output in IMG format. It does, however, have postscript output, which can be printed or converted to IMG using ghostscript. Unfortunately the axis labels and other text produced by gnuplot are not exactly beautiful.

I have used Gnuplot on the ST a fair amount, and it seems quite stable.

>In the UK a large number of people cannot access US ftp, so c.b.a.st is one of
>our few sources of new pd/shareware software.

This is the one main argument for the binaries and sources groups,
and I was waiting to see if anyone still was in this situation. While
ftp is definately more efficient, if enough people are using mail
servers, the binaries and source groups are actually more efficient than
mail. However, as people seem to not be submitting things, the only way
it can keep working is if someone takes over the group who actually
wants to go get stuff for distribution. Obviously this needs to be
someone at a well connected site who doesn't pay by the hour for their
access.
The other thing about the binaries and sources groups seems to
be the catch 22 of the situation. If people don't see much happening on
the groups, it won't occur to them to send the files to the moderator. I
know there are plenty of people who are getting their feeds though bbs'
that don't have ftp, and limit the mail recieved. The binaries and
sources groups are the only way that these people can get software.

I used to have an CHINON F354 drive but it's toast so I got a
new CHINON 720k as a replacement, an FZ354. The problem :(is that it
doesn't recognize a new disk having been put in the drive(unless it's
write protected). 'ESC' won't work and the Forced Media Change program
also is a no-go.
Question: Can this FZ354 be fixed with jumpers or is it time to
call TEAC for a replacement?
If you need any further info, like how I have the jumpers set, say
so.

Well, sure, but sounds like a small market to me. I think it seemed like
a double-edged sword, hurt Atari and make money doing it. :-}

>supported???
>

To answer the second question first, I received a communique' from Emagic
when the product shifted companies saying that they would indeed continue to
support Notator on the Atari platform.

As for the first one, it's no secret that notator (any version) did not work
properly with 16MHz accelerator boards on ST's so it doesn't surprise me in the
least that it won't work on the Falcon. It seems logical, however, to expect
Emagic to modify the code so it will work on a Falcon, it can't be too big
of a mod. Still, this is all speculation, and we could end up screwed. I would
be really pissed if my $500 notation program were suddenly unsupported.

528. ST stuff for sale

Newsgroup: comp.sys.atari.st
Date: 1993-01-11 22:40:26 UTC
From: eggert@sun.lclark.edu
Message-ID: <1993Jan11.224026.5287@lclark.edu>
Source record: 212460

From: eggert@sun.lclark.edu (Jonathan Eggert)
Newsgroups: comp.sys.atari.st
Subject: ST stuff for sale
Summary:
Followup-To:
Distribution: world
Organization: Lewis & Clark College, Portland OR
Keywords:

I still have the following items for sale: $350 Takes all, or split up as
follows...

Atari 1040 STf - $190
1 meg RAM
with Atari mouse
Atari SC1224 - $75
Screen bows at top and bottom. This is
apparently due to a burned out capacitor.
Should be an easy fix.
VideoKey - $50
Use a TV or VCR with your ST.
Works great!
Monitor Master - $29
Switch monitors without unplugging
and plugging.

Software -
Laser C compiler. . . . $30| or both for
Laser C Debugger package. . . $20| $40
GST C Compiler $10
Personal Pascal $10
Quantum Paint $8
BBS Express! ST $20
Universal Military Simulator . . $12
Falcon Flight Simulator. . . $18
Bloodwych $18
Chrono Quest $18
Carrier Command $18
Gone Fishin' $8

Again, all of this could be had for $350. I will pay shipping on any of this
assuming it is pre-paid. I will ship c.o.d. if desired, but I ask that the
buyer pays for that ahead of time (I got royally screwed on a previous
deal that ALL of this was supposed to go with).

Uh, I think you mean "loan," not "lown," unless they spell it differently
down-under.

And you mean that the "DEC VT100" in the terminal settings menu (the one
that I'm using right now to write this message on-line in vi) isn't really
VT100? And STalker can't use CTRL-W? I thought it could.

Of course, the *day after* Atari goes bankrupt, you just have to get rid
of your ST. NOT.

Also, it may be fine to have something like Gemulator around *after*
Atari is dead, because it is then not hurting Atari hardware sales.
However, before they're dead, it just helps people abandon ship.

From the Holy Book of <1is074INNig2@escargot.xx.rmit.OZ.AU>
as spake by rasas@minyos.xx.rmit.oz.au (Greg Patten) :

> [...] I have found some src (eg tip
>for MiNT by Howard Chu and some Un*x stuff) but it always seems to
>rely on some struct (like the one defined in xbios.h (?) which isn't
>included in the new sozo mint include stuff).

Right. That code was originally written for Mark Williams C, which does
things slightly differently (different header files, different struct
layouts, stuff like that). It does require some modification for HSC.
I'll mail you some diffs.

>I'm sorry if this is a stupid question but I'm new to programming
>and I don't really have much documention.

Like diving in head first, eh? ;)

>Also, is there new docs for the mint dlibs or is it a case of 'use the
>source'?

"Use the Source, Luke." Actually, though, large portions of the
MiNTlibs are similar to the Unix libraries, so if you have access to a
Unix system, you can check the man pages there.

Good luck!

Yep. By Diablo and FX80 _emulator_, do you mean what is called a driver on WordPerfect, and other programs? Or is there some sort of emulator cartridge like for the HP DeskJet?

The arguement was: for people with a more limiterd cash-flow than _you_ are
used to, a computer that can/was-designed-to run without a hard-drive is
STILL the best option. I'd like to see you try to get around on that clone
without your hard-drive.

>>> That's a GOOD one. $50 is *real* tough to manage for an OS, yeah.

> software you want? Buying a $1000 machine and then saying you don't
> have $50 for a software pacakge is like buying a Ferrari but then not
> being able to cough up money for wiper blades.

First of all, the OS doesn't give me problems as is, so the $50 stays in the
bank for me. Second of all, I'll ask you not to be my finance advisor. I'm a
quite-typical college student with no spare money. I have not always been a
college student/I used to have the cash to buy software. If I'd bought into
the clone-realm then, it's not likely I'd EVER have as much software as I do
now (speaking commercially. I have no (and I don't need) knowlege of the
shareware dimension of the clone-realm). This machine still has the
more-affordable software for me.

>>> Right, and consequently you have to pay $75 to upgrade the OS. That

> as is required for the wiper blades!)

It is the money, it isn't the money. I can't argue on dualistic gounds as
those. And really I don't have much inconvenience getting PD stuff, which has
consistenly been enough to keep me going (hopefelly will be until I can
actually afford to shop the commercial district again.)

>>What's the point to trying to get a PC put together the right way to do what

"Standard" or "tradition" are not a good arguement for anything. And I think a
more appropriate comparison would be pencil with hand-eraser vs pencil with
eraser on the end. A matter of convenience.

>>I believe someone said something about that being a beta copy, or unliscenced

Could you be more specific? And FYI, if I try, I could _probably_ find soime
fault with ANYTHING or ANYONE you could name. I've never seen a computer or a
person I thought was perfect. Tell me how I make the ST market suck, please?
"PC people pay for software in enough numbers..." Could you say 30% of the PC
user market is onboard because of the fantastic piracy network? I'm certain it
dwarfs any such network Atari may/may have had. Whatever.

>>Anywho, it sounds like you're on the right track. Buy what you need.

In a couple of years, when I intend on investing in a new system, and if I still have InterNet access, I'll let you know what I decide. You're probably right that it won't be a 68000 machine. It'll probably be along the lines of a 68040 or whatever the price/perfomance ratio bears out from the market.

-Matt

There was a time when owning an Atari was fun and interesting; the two are correlated.

>I'm afraid the biggest cause of the
>current S/N ratio is the continuous stream of pro/con Atari threads -- with
>a functional contents of approx 0.00, always repeating the same religious
>arguments, etc, etc.

Functional contents of 0? On the contrary, there's been enough good information in these threads that by reading them alone (and taking them to heart, and acting upon them), Atari could make a good start at turning things around. Not only that, but LET THIS BE A LESSON TO YOU when you buy another machine. Quite educational all around, I think.

Besides, if you don't like reading stuff from any of us (on either side of the issue), just kill our messages. Are you proposing we should censor ourselves so YOUR personal newgroup experience will be better?

>In the meantime I think I (and most other c.s.a.st readers) know all about
>Atari's inadequacies. There's little use in repeating the same stuff over
>and over again. Please, tell me something new.

Something new: You're wrong if you think every reader of this group knows how "inadequate" Atari is now. While there are deluded people left I feel an obligation to counter the cheerleading. I've been a part of this community for 7 years, and I've put an incredible amount of energy into it -- emotional and otherwise. Why should I let people revise history? Why should I let people say things like "Double Click DESERVED to fail," when I know that's not true? Why should I let people say, "The Falon doesn't need expansion slots," or "The Falcon runs better OS's than the PC?"

>And another obvious remark: if people really hate Atari that much, why do
>they make themselves (and others) tired with writing articles in this
>group?

Partly because I don't want people to be conned into wasting money on a company that doesn't give a good goddam about its users. (Yes, despite the fact that Eric Smith posts notes about MiNT/MTOS every once in a while.)

Atari is now a small cadre of fatcats that are making a quick buck off
their remaining supporters' ignorance. It's reprehensible, and I see
no reason to let it go unchallenged (like 99% of the former Atari
developers, who just up and left without setting the record straight
with "the masses"). I care, OK? So shoot me.

How can you possibly say

>Yes, indeed, I'm not interested whatsoever in what anyone thinks about Atari.

and then

>That's why I'd like to see some threads moved, aborted, killed, stopped.

in the same breath? The reason people like me don't post lots of
technical info here anymore is because there's nothing to talk about!
Any of us who had any desire whatsoever of making money in the ST
market have either long left, or have long since realized the ST market
is dead. You expect me to add stuff to the picture formats list, or
write more sample playing utilities now? No one gives a damn
anymore, because the market is *dead*.

>And please, don't yell that much. There's nothing wrong with my eyes
>or ears.

If you want to set the tone of the group, why not post some "good
technical info" yourself? I didn't come up with stuff like that out
of thin air, you know. It takes work to write a 5 page article
on playing samples (or whatever). Be our guest.

>>BTW, if you want a new group, read news.announce.newgroups and learn
>>about the hideously annoying (and flame-prone) process you have to go
>>through before you can create it.
>
>I know all about it -- that's why I'm not running a RFD or CFV (sp?)...

Well I did, for comp.sys.atari.st.tech. That's my useful techinical
contribution for the decade.

>You needn't respond unless you really feel the urge.

I guess I'm just too rabid to resist.

>To Dave B. - Chill out. You're becoming positively rabid in your posts
>to well-meaning Atari ST users.

Oh, so "well-meaning" Atari ST users can dish it out, but they can't take it, huh? If I recall correctly, I was the one who got slammed with a couple hundred "rabid" messages only a few months ago when this all started. Let's see ... was it my post about visiting Atari, perhaps, that set everyone off? Could it have been? Yes, I think I've got that right. That and "Closed Architectures."

>I did find your posting on ST Picture
>Formats a refreshing change from the usual "you suck eggs" style that has
>become a favorite of yours.

Well, I'm glad you liked it.

>Remember, all the good things you've done for Atari ST users won't
>mean a thing when your gone; you'll be remembered as "That guy who
>hated anyone who liked the Atari ST".

Heh-heh. Do you think I'm in this for ego gratification or something? I really don't care if people remember that way, or any other way. I care a lot more about preventing more people from getting sucked into the Atari Lie by the rabid (correct word choice this time) Atari fans, who -- either through ignorance or malice -- fabricate data to get other people to sink money in a company that is the biggest disgrace in the history of the personal computer industry.

I would CHANGE MY ATTITUDE OVERNIGHT if Atari got all new management and started putting the pieces together and working on interesting new prodcuts (and treating developers with respect) again. WRITE THAT DOWN. I'll eat those words if they do it and I don't.

You paint a very simple-minded picture of my motivations. You also try to scare me out of saying what I think with predictions about my "reputation." Neither of these things is useful.

>As for those psychopaths out there who think that a few deaths are in
>order for the Tramiel family (you know who you are), get a life.

I agree that wishing ill upon CEO's of companies you hate is out of line, but I think the sentiment is well-taken. How many people have the Tramiels screwed out of money? How many people have they sucked into

buying the computer equivalent of a junk bond?

>Or perhaps, you need to engage in some consensual sexual activities.
>Maybe both.

You're WAY more out of line here than anyone you mention.

>When you hear something of interest (and I *don't* mean stock quotes)
>about the ST, write about it.

Whoa, what's wrong with stock quotes? How are they not appropriate
news in an Atari newsgroup? It seems like you're asking people to be
POSITIVE fact-finders. Sounds like a propaganda campaign to me. By
all means, post the positive, but allow the negative to come through
without a fight as well. I shouldn't have to take megabytes of abuse
just because I give 101 reasons why Atari could use some fixin', should I?

>You can regain a measure of control of this newsgroup, or you can let it
>become a source of personal pleasure for folks like Chris Mauritz, who don't
>even OWN an ST anymore; they just leave messages for the pure joy in watching
>you squirm.

Marshal your forces all you want. You won't be able to twist reality
outside of your little universe no matter what you do. If we all care
about Atari, we needn't take sides like that. (And, as I've said about
three dozen times, evidently to deaf ears, I DO care about Atari.
Otherwise I wouldn't waste my time writing messages about their faults
or the inadequacies of their machines. If you think I'M hard on your
Party Line, you should listen to what the Real World is saying.)

>Don't bother, the guy is obviously thick, saying there is no CLI for
>the ST, (ever heard of UNIX!? And the hundreds of other PD/shareware ones)

Look Steve, get a grip. You know I know what I'm talking about here;
I've written programs for the ST, remember? There's no Atari CLI;
they're all third party products. In other words, there is no
equivalent to DOS in the Atari world -- as far as ATARI is concerned
there IS no CLI. That's all I meant, OK? And most programmers know
that you can get a lot more work done with a CLI than you can with WIMP
interfaces anyway.

Second, the ST doesn't run Unix. It can't run Unix because it isn't
capable of doing virutal memory. (It does run Minix, though; I'll
give you that they're similar.)

Finally, if you're going to followup a post of mine, you could at least
insult me by name.

>Hard drives are not 'cheap', $250 is a lot of money for poor folks like
>myself! (For a decent drive....)

Yet you (pl.) expect us to put in the X thousand hours required to
write something Game Workbench when you can't pay the $200 or so it
costs to justify making it?

>So GEM is not a Real OS is it!? Damn, what have I been using for the
>last 5 years then!?

An early, buggy version of a poorly designed single-tasking OS.

>world do you seriously expect game writers (ie people trying to screw the
>maximum performance out of a machine) to worry about their program being
>a little incompatible with future generations of chips?

Yes. Case in point of bad programming of this ilk: STOS. Every time
the slightest change was made to the OS they had to send out an
update. You don't have to break the rules to get the best performance
possible out of the machine. Get things fast is one thing. Getting
things fast, and properly, is far better.

>Particularly if they are not even aware of the these new machines etc
>when the software is written.

In some cases of course, they are victims of what you describe here.
If the computer company rips the rug out from under the programmers,
there's no one to blame but the company. But Atari hasn't really done
that; they've said (in their own muddled way) what you could and
couldn't rely on, and they've done pretty well at not screwing
programmers who followed the rules.

>Maybe you would prefer it if the games were a little slower or a little less
>impressive, but I certainly wouldn't.

Following the rules will NOT slow your program down. Game Workbench
runs fine on Falcons and TT's, and we never had those machines to
develop on. It was more time-consuming, in some sense, to be careful
to follow the rules, but doing so did not affect efficiency any.

>--
>------------------==------------------
>Chris Herborth
>cherborth@semprini.tdkcs.waterloo.on.ca

Er, even though I've been quietly watching all this, I have to toss out
a point. Everyone assumes MS-DOS on the PC for pretty much the same reason
everyone says GEM on the Atari.... The comparison is not exact but is fair.
MS-DOS (perhaps running Windows) is still pretty much the minimum you can get
by with on the PC. GEM is the minimum for the ST. You can add NeoDesk or
whatever to GEM in much the same fashion you add Windows to MS-DOS.

(I may be wrong on this but isn't MS-Windows an application that runs
ontop of DOS? Much like GEM runs on top of TOS?)

In any case, my point is mainly that if you allow all PC/Clone OS/s and
GUI's into the arguement, it is probably fair to use all the Atari alternatives
as well....

Another idea to think about is the concept of "sunk cost". The money
I have spent on my Atari system is gone. I can't get it back - it does not
in any way figure into whether or not I should buy an IBM. I might like to
buy CORALDraw, but the additional cost of the new computer makes it prohibitive to me. It
would actually be easier to by Avant Vector at $400-$500.
THe point of this is that it seems we are argueing apples and oranges
now and then. There is a difference between scraping your Atari system for
an IBM (which I cannot right now concieve of doing) or by an IBM instead of
an Atari (which I might do, if the cicumstances were different). This is
actually a problem for the Atari world since by and large only the first case
leads to new Atari Users. Atari needs to find some way of bringing the second
kind of choice back to their side of the equation. Which the Falcon may or
may not do. (It all depends on whether they (Atari) can break into some sort
of new market and stay there.

I've said too much already....

Wakey-wakey Dave. Atari's soon not going to even HAVE a 68000 machine
in their line -- they're just too darn slow by today's standards.

If you bought a "new machine" and it was an ST, then you've just popped
through a time warp. Check out the prices 1040STe's are being flogged
off at by long-term Atari dealers - it's a runout sale. I picked up
a SM146 for $AU190, which is quite a saving!! They're all about to
become obsolete [though the SM146 is a *nice* monitor!].

Smell some roses for a change.

OK folks, since there's been almost as much bitching about the bitching as there has been about anything else, I'd like to suggest a minor modification to our posting behavior that I think will save us all some grief. (This will probably seem like an insane fit of reasonableness on my part to some of you.)

I propose that from now on any message in this group that's predominantly about the virtues or flaws of a personal computer (Atari or otherwise), or about a personal computer company, should have the word "ADVOCACY" in the the title. That way people who don't want to read such posts can kill them, and people who do won't be bothered by all the annoying bitching about the bitching. :)

NOTE: This will only work if you do it. (This means you too, BobR!) :) Take care to remove the ADVOCACY keyword from "normal" followups, too, since some people will immediately kill everything that has even the SMELL of advocacy in it. :)

Creating an advocacy group will take at least 6 months. While I think it would be a good idea to have one, I'm not about to volunteer to run the vote. Could some kind victim ... I mean, volunteer get the courage up to do it?

Source record: 212328

In my case, I DON'T have ftp access, but I also don't have access to
either the comp.sources or comp.binaries groups.

(My feedsite won't supply them on the grounds that if he gives me
the atari groups, he'll have to start supplying other machine's
binaries/sources groups, swamping his hard drive space.)

Maybe I'm out of line here, but it seems that perhaps the atari groups
are due for a re-organisation.

Is there sufficient traffic to justify something along the lines
of the os2/ms-dos/amiga heirarchy structure?

(Currently I'm getting around 500k/week over the 2 comp.sys.atari groups)

In article <1993Jan11.205852.13486@bsu-ucs> 01mbmccabe@leo.bsuvc.bsu.edu writes:
>The arguement was: for people with a more limiterd cash-flow than _you_ are
>used to, a computer that can/was-designed-to run without a hard-drive is
>_STILL_ the best option. I'd like to see you try to get around on that clone
>without your hard-drive.

I don't recall that being the argument at all. I recall the argument being a general "MS-DOS machines suck" one. You can do just as much with a hard-drive-less PC as you can with a hard-drive-less ST. You don't HAVE to run Microsoft C; you can use Manx, which (I think) costs $19 too.

There *exist* programs on the PC that do far more than their ST counterparts, and because of that they take more room. But there are plenty of things you can run from floppy that are perfectly decent. (Of course, if you had a PC you'd probably have a 1.4M drive so floppies would be less of a problem.)

>First of all, the OS doesn't give me problems as is, so the $50 stays in the
>bank for me.

The "if it ain't broke don't fix it" argument, round 117. The OS *has* plenty of problems, in my view. For one, the 40 folder bug is STILL with us. On a more "abstract" level (bear with me here), we have missed out on such wonderful improvements as multitasking (MiNT isn't part of the ROM chips, of cours) and support for international character sets. One major reason I'd like to have a Mac (and yes, I know I can run Spectre GCR, but I want System 7), is that you can do Japanese word processing on it seamlessly. Where is Atari's answer to WorldScript?

>Second of all, I'll ask you not to be my finance advisor. I'm a
>quite-typical college student with no spare money.

Again: don't buy the Ferrari if you can't buy the wiper blades. So you've overinvested in your hardware and now you can't buy any software. Is there any other way to slice it? BTW, you're not saying anything unfamiliar to an Atari developer when you talk about not having money.

>I have no (and I don't need) knowlege of the shareware dimension of
>the clone-realm). This machine still has the more-affordable software
>for me.

So ignorance is bliss, huh? I don't like that philosophy myself, and when I started looking into the PC market carefully a year or so ago I was surprised at what I found: shareware terminal programs that beat

Uniterm, editors for $50 that annihilate Tempus and are programmable in
C, all the GNU stuff, 4-DOS, Borland's excellent source level debugger,
etc. etc. There's a world out there! Why do you *want* to stay
uninformed? Wouldn't it be better to know all the facts and then
DECIDE to stay with Atari?

>It is the money, it isn't the money. I can't argue on dualistic gounds as
>those. And really I don't have much inconvenience getting PD stuff, which has
>consistenly been enough to keep me going (hopefelly will be until I can
>actually afford to shop the commercial district again.)

Well, we're not going to be writing PD stuff for you much longer, so
you better start thinking about paying for software if you want to keep
your machine alive.

>It's not even a matter of mediocrity! It's a matter of whether or not yopur
>computer does what's expected of it! Stop trying to spread the clone-disease
>and start spreading some common sense!

"The clone disease." An unbiased statement for sure. You don't even
know what's out there, yet you call anyone who dares to praise the
clone world "infected." Common sense says your machine is going to be
a doorstop within a few years at the rate the community and Atari Corp.
are going. One day you'll wake up and all of us who have been writing
all that free software (or -- HA! -- "shareware") for you have stopped
doing it because we had bills to pay JUST LIKE YOU DO.

>> Again, I hope you're happy being less productive than you could be.
>> I'm not.
>
>I also ask that you not be my time manager. I haven't hit any speedbumps on
>this road yet, and I don't anticipate any in the near future.

Look, can the stupid semantics games all right? Are we having an
argument here, or are you telling me why I'm not a nice person?
Wouldn't you think it was funny if someone told you they were doing
just fine with a 1960 UNIVAC that only accepts punched cards? Wouldn't
you want to convinced them that there's a whole generation of software
and hardware improvments available waiting to make their lives easier?
Not *wanting* multi-tasking is a clear sign that you've never had it,
or have never had to do any serious work with a computer. We've
had multi-tasking since the 60's!

>Or the people are raving for some of the wrong reasons...
>("My computer has slightly newer technology, and an AWESOME pirate base!")

Sigh. I hate to be demanding, but do you have any facts regarding
piracy on the ST and PC that we can compare? "It seems like there's
more piracy on the PC" is hardly any evidence. Keep in mind that even
if there are 100 times as many pirates in the PC world as there are in
the ST world, we're still even percentage-wise.

>> The main thing I spend time with nowadays on my PC is TADS 2, which is
>> shareware and registered, thank you. (And yes, I did buy my copy of
>> Microsoft C, which was $139, and Ultima Underworld, which was $50.)
>
>I'm glad someone's making money around here! If I don't gradute soon, I'm
>gonna have to buy the place! This is crazy!

I'm a student too, and the day I got an eviction notice a few years ago
it was accompanied by a letter from someone who told me they wanted one
of my shareware games but "didn't have the $10 because they were a poor
college student." It was so ironic it made my day.

>P.S. Is Ultima Underworld, the Ultima that's a lot like the old Dongeon Master
>game?

Yes. Like Dungeon Master with complete freedom of movement in 3D.

554. Re: Falcon030 competes with '486dx-33

Newsgroup: comp.sys.atari.st
Date: 1993-01-12 05:27:54 UTC
From: dcable@nyx.cs.du.edu
Message-ID: <1993Jan12.052754.9131@mnemosyne.cs.du.edu>
Source record: 212482

You might want to just wander over to the OS2 newsgroups and look around before getting one of the Zeos systems that you were quoting the prices of. That operating system wants lots of memory, lots of harddisk and lots of CPU speed. There are also problems with certain video boards and other perpherals (especially SCSI stuff). That, unfortunately, is one of the problems that you get with open architecture.

>Could you be more specific?
>Tell me how I make the ST market suck, please?

I thought I was being pretty specific, but here's a *really* specific
statement for you:

1. You don't pay for software (because you have no money).
2. ST developers don't make any money selling you software.
3. Consider a market consiting of a million people like you.
4. ST developers have to leave the market.

That's why YOU are part of the problem. This is EXACTLY what the ST
market is like now. How many people here have already said they stick
with their Atari's beause of all the freeware and "shareware" out
there? What does that say about a commercial developer's chances?

>"PC people pay for software in enough numbers..." Could you say 30%
>of the PC user market is onboard because of the fantastic piracy
>network? I'm certain it dwarfs any such network Atari may/may have
>had. Whatever.

You're really piquing my interest here. Why don't you let me in on
your details of the vast pirate empire for the PC? Be sure to
cite figures for the ST market that back up your assertion. I
want BBS numbers too -- maybe I can get some RAD NU WAREZ D00D. :)

>In a couple of years, when I intend on investing in a new system, and
>if I still have InterNet access, I'll let you know what I decide.
>You're probably right that it won't be a 68000 machine. It'll probably
>be along the lines of a 68040 or whatever the price/perfomance ratio
>bears out from the market.

Given this thorougly intelligent closing statement, it's clear that you
have misinterpreted my defense of the PC as an attack on the ST. I
have no problem with the idea that you are happy with your ST (except
to know that you are living with something that is slowing you down).
The point of this all was that RIGHT NOW, IF you were buying a NEW
machine, a clone would be a very intelligent choice, simply on a
price/performance basis. If you look at the lingering title of this
message, you'll see that it's one Atarian's misguided assertion that
"PC's are bad because all the software is really huge." When I pointed
out that it's not that simple, you kicked into defensive mode and
started telling my why your ST was a wise purchase when you bought it
years ago. I have no argument with that. My ST was a wise purchase 7
years ago too. (A clone would have been a wiser one, but I of course

had no way of knowing things would work out as they have.)

> in their line -- they're just too darn slow by today's standards.

Warwick! I was beginning to feel let down that you weren't
contributing anymore! Like it or not, though, the 68000-based machines
are really the only affordable machines Atari has. The TT is no longer
even vaguely competitive from a price/performace standpoint. As for
the Falcon, it's already a bit behind the times, but it'll certainly be
a vast improvement over the ST. If Atari sells the Falcon for $250,
I'll buy one. How's that? THAT would be competitive.

Of course, they have to MAKE them first. Minor detail. Darn
pesky factory workers! Can't even pronounce "Tra-mell" correctly,
much less meet their production quotas.

>If you bought a "new machine" and it was an ST, then you've just popped
>through a time warp. Check out the prices 1040STe's are being flogged

ST's are being dumped left and right because they're becoming door
stops. Nobody wants a computer for which no new software is being
written any more than they want an 8-track tape player. ("All my
tapes sound JUST FINE on my 8-track. I don't NEED a CD player.")

>Smell some roses for a change.

This is finally getting fun again! :)

>Yep. By Diablo and FX80 _emulator_, do you mean what is called a driver on
>WordPerfect, and other programs? Or is there some sort of emulator cartridge
>like for the HP DeskJet?
>
> -Matt

Well it's not a cartridge. The diablo emulator is just a program you
run before printing (or at startup). Any text output is redirected to
the dma bus. It does also do bitmaps however (ghostscript and tex
use this for example). I don't think this was a diablo feature :-)

The fx80 emulator is an accessory which is a bit smarter, but it uses
a huge amount of memory (configurable, but for bitmaps you need at least
about 1-1.5 meg) immediately after startup, while the diablo
emulator just needs 1 meg when you print something.

I have an Atari ST computer system for sale. I will sell it either in
peices or as one big package. Here is what I have:

Hardware
========
Atari Mega ST4 Computer (w/ TOS 1.4, Mega STe keyboard,
and GoldenImage mouse) $500
Atari SLM804 Laser Printer $500
Hard Drive case w/ ICD Advantage Plus Host Adapter
w/ ICD Hard Drive Utilities 5.6.1 $150
Seagate ST296N 85Mb Hard Drive $225
Amplified Stereo Adaptor $30
2 TAC30 Joysticks $25

Software
========
Calamus 1.09 $100
GFA Draft Plus $15
WordPerfect 4.1 $100
Red Storm Rising $25
Ultima IV $25
Planetarium $25
GFA Basic 2.0 and 3.0 w/ ref manual $75
UltraScript $75
BBS Express! ST 1.79 $75
Lots of PD stuff FREE on Hard Drive
==========
Total $1945

Entire Package $1800

If you are interested, I (Chuck) can be reached at:

509-235-8746 (voice),
509-235-4875 (BBS),
CAUDE1 (GEnie),
Chuck Aude at 1:346/18.0 (FidoNet),
or Chuck.Aude@f18.n346.z1.fidonet.org (InterNet).

>
>I'll still get a Falcon, but we need to get correct info on the opposition if we
>want to beat them!

There is no way to disable the new AA [AGA] functions in the 1200. Software that changes the wrong bit in the bitplane control registers can still cause problems. It's ironic, though, that Commodore threatens never to release another hardware manual, though. They want people to program "cleanly" but this be counterproductive.

The Falcon is a nice machine and I intend to get one, whether or not Atari is around at the time. I know a considerable amount about the standard ST and standard Amiga hardware and if the 1200 is 2 steps forward for the Amiga 500, then the Falcon is 10 steps for the Atari 520ST. There is a clear advantage that the Falcon has the DSP as standard hardware in that the DSP is a fully programmable processor in itself, fully capable of running it's own software like the 68030, but being able to do many things much faster than the 68030 ever could. It is hard to say at this point, but I would assume that one could find several applications in which the Falcon would perform 3 or 4 times faster than the A1200.

From: qb7g6@fel.tno.nl
Message-ID: <1993Jan12.091532.26059@fel.tno.nl>
Source record: 212311

Hi,
I have Hermes 1.03 installed now. I can send mail, receive mail, read news.
But I haven't managed to post an article yet. (This posting is done
elsewhere)

I suspect I have to put a line in the "sys" file. But I don't have a
description of the file's format; there is no sys(5).
Can anybody please enlighten me?

Are you Hermes users pleased with it? Are there alternatives?

Thanks!

> files into one. Finally compiled after a few options had been changed.
That's a bit excessive isn't it? Wouldn't it have been more sensible just
to use someone else's make? In fact, GCC doesn't come with a make utility,
its just that Gnu Make is part of the same project. You can use Gnu Make with
Lattice quite happily, though personally I prefer Dmake. As far as compiler
options go, I get most Gnu and Unix stuff to compile by using 32 bit ints
and the non base relative option (the latter not always needed). Since 32 bit
ints is the default, that's only one option. A CC compatible driver for
Lattice would be really nice though - I keep on meaning to write something,
but I've already got far too many partially completed projects lying around 8-(

> Code ran and exited immediately, saying that the stack was full.
Look under stack in the manual. The default stack size is 400k, but altering
it is extremely easy.

Hi,
I just have uploaded the newest version (1.22) of our TCP/IP software

to the server sun5.iaee.tuwien.ac.at (fortec.tuwien.ac.at) today.
We use it to connect our ATARIs to SUN workstations.
It is based upon (Ethernet) packet drivers hiding the hardware from
the IP layer, so it can easily be adapted to different ethernet cards.
At present we use Ethernet cards from Riebl Germany for our
MegaSt and TT as well as a Dlink DE600 pocket adaptor which connects
to the cartridge port of each ST via a tiny, self-made interface
(some small hardware could be used to connect it to the parallel
port too).
Packet driver sources (Pure-C) are included, as well as some
application programs we have written.

Peter.

GMAFB.

Someone asks to be convinced to stay with Atari (and I know Chris, and
I'm pretty sure that it was an honest request), and all you can do is
say "Take off, we don't need you". That says two things to me:

1) There is nothing Atari's most rabid supporters can actually say in
its favor.

2) Users such as this needn't blame the Tramiels for Atari's
downfall--telling everyone who wants to be convinced to "take a hike"
is pretty poor P.R.

Sorry, I've got more than two things.

3) This is about third grade recess levels of maturity, so take your
bat and ball and go home, and try to catch those left fielders
yourself.

I can perfectly understand Chris' situation--wanting someone to
convince him to stick with a platform that he feels some loyalty
toward, I'm feeling it myself these days--and I'm amazed at the
helpful reactions he's gotten.

Mike.

Before you skip this OLD subject, I'd like to say that version 1.1
is now finished! features are:

vvvvvvvvvvvvvvvvvvvvvvvvvvv
10 sector 80 track disk!!!!!
^^^^^^^^^^^^^^^^^^^^^^^^^^^

Faster loading time
keypad can be used for cursor movement on foreign keyboards
engaged bug fixed
random name assignment if required
re-entry of a wizard's details if required
quit game hot(ish) key

I think that's it..it'll be on a.a and uni.ftp-kl.de tomorrow,
time permitting...
It'll probaBLY be MSA'd since LHARC gives 0% compression...
SO there!

Thanks for your time,
Martin

> supported???

I have heard complaints that C-Lab Notator 3.15 hangs "just before the main screen appears" on *any* machine.

I purchased Notator just before Christmas. I received E-magic Notator 3.16. I was told by the U.K. distributor that:

* E-magic Notator 3.16 is exactly the same as C-Lab Notator 3.15, but with different packaging (perhaps without the alleged "hanging" bug).

* The two people who hold the copyright to Notator have left C-Lab and taken Notator with them to E-magic.

I would assume that it would be in E-magic's best interests to make whatever (presumably minor) modifications are required to make Notator run on the Falcon.

As a sidenote:
Is there a file available containing developer's names, their
addresses, and contact points? And the software they produce? Atari
publishes similar information but it's not freely available.

>interfaces anyway.

Uh, Dave, Microsoft makes DOS, not IBM (i.e. 3rd-party again). The
fact that they have a virtual monopoly on IBM DOS (except for DR DOS)
makes them the standard. As for "wimp" interfaces, would not
OS/2 and Windows then be considered as well? (being non-CLI?).
And those are the main selling points for the PC's right now (if my
286 had the power, I'd probably put one of them on there, but as it
doesn't at the moment, I don't). I sometimes will run MiNT/TcShell
combination, as the commands, etc are just about identical to unix
(actually taught myself some unix by playing with the combination) -
so while it's not an "Atari standard" it is easily used by those who've
played with unix...

>Second, the ST doesn't run Unix. It can't run Unix because it isn't
>capable of doing virutal memory. (It does run Minix, though; I'll
>give you that they're similar.)

Dave, could you give me a short description of virtual memory and
what it takes to do it? I assume (correct me if wrong) that the Windows
SWAP file would be considered virtual memory? Why would doing something
like that not be capable on an Atari? Just curious.

>Finally, if you're going to followup a post of mine, you could at least
>insult me by name.

Or better yet, not insult anyone at all!

>>Hard drives are not 'cheap', $250 is a lot of money for poor folks like
>>myself! (For a decent drive....)
>
>Yet you (pl.) expect us to put in the X thousand hours required to
>write something Game Workbench when you can't pay the $200 or so it
>costs to justify making it?

Depends if you could use the software. Something like Game Workbench
would seem like a great thing for game programmers. But for simply
hobbyists, it does not seem necessary. And this net seems to be
inhabited by more hobbyists that "professional Atari programmers." (there
are some, like Eric Smith, etc, but the majority are probably not
Atari programmers).

As for the hard drive, probably the best investment I've made in
my system (makes life SO much easier to deal with instead of disk
swapping all the time). And to think, I survived on an Atari 8-bit
with CASSETTE RECORDER for like a year. But of course, I was a
kid, and barely had enough money for a couple comic books, much less
a hard drive (BTW my first computer was a Christmas present I asked
for, since I couldn't afford buying it then). Of course, I'm still
stuck at 30megs since right now I can't justify getting a larger HD
yet. I'd like one, but I have other things to worry about as well
(rent, car payment, etc)...

>>So GEM is not a Real OS is it!? Damn, what have I been using for the
>>last 5 years then!?
>
>An early, buggy version of a poorly designed single-tasking OS.

But it works and is functional. An OS is supposed to be
functional, not *necessarily* elegant (though it could be). I went
from TOS 1.0 to 1.4 and finally 2.05, and have had very little
problems in the process.

You must be kidding. When I was a college student, there were approximately
5 or 6 ST BBS's in New York City. They were ALL pirate BBS's. That's
right, they were ALL pirate BBS's...100% of them! I knew several of the
sysops and I was a cosysop on one of them. When I found out about the
piracy, I started deleting the files as they were uploaded. After getting
yelled at by the head sysop, I quit. They used to have meetings where
they would literally conspire together so that they didn't "waste" disk
space on the same pirated files.

Perhaps, the real reason we "sing our song" is because we get better
quality and value for our bucks....

Regards,

Chris

OS/2> just because I give 101 reasons why Atari could use some fixin', should I?

I think stock quotes are a valuable tool for seeing how investors view
Atari. Yes, those are the people who do not have an Atari oracle on
their desk and who look at the profitability of the company and the
competance of the management. I wonder how long it will be before
NASDAQ unlists Atari all together (it is practically a penny stock) and
ATC is relegated to the likes of the Vancouver exchange...Imagine that....

OS/2> >You can regain a measure of control of this newsgroup, or you can let it
OS/2> >become a source of personal pleasure for folks like Chris Mauritz, who don't
OS/2> >even OWN an ST anymore; they just leave messages for the pure joy in watching
OS/2> >you squirm.

I cannot help but be flattered. If I convince one newby to dismiss
Atari computers as an electronic toy, I feel morally justified. I
hate to see people go out and purchase one of these paperweights based
on completely biased and false propaganda from the cheerleaders on
the net and then realize that they'll have to give up their left nut
to find software for it.

Skoal,

Chris

OS/2> problems that you get with open architecture.

That is not true. OS/2 wants "lots" of RAM only by PC standards. The
operating system takes up between 18 and 35 megs of disk depending on
what features you want available. That is par for the course for a
decent OS. As for processor speed, I have seen OS/2 run nicely on
a 386/16mhz box. RAM is the critical factor (just like unix). If
you have 8megs or more (and why not when it costs $30/meg???) there
are no more speed problems.

Re: open architecture problems

I couldn't agree more. It is difficult to support all of the
different devices, but at least they are trying instead of
forcing you into using their hardware (like Atari).

Followups to comp.os.os2.advocacy....

Cheers,

Chris

> Well not wanting to get into a flame war with you Dave or anyone in
> paticular, but do you not think this in itself is a defeatist attitude?

How is it defeatist? Writing good software takes an enormous amount
of time, and in the Atari market it's done with no thanks at all.
The attitude of "why bother" is the Atari spirit now, it seems.
"Why bother trying to get new users on board?" "Why bother trying
to keep developers happy?" "Why bother sending in my shareware
payment? Let Dave Baggett rot in hell!"

> I personally do not mind if you will or will not write software for me
> as a user, as I have all the software I need and it consists of only
> a few packages these days.

I have ten things to say: "Me me me me me me me me me me." While many
of you who still vehemently claim the Atari is a "fun" computer to own,
and that companies should develop new things for th ST/TT/Falcon
series, you exhibit this kind of "ME" attitude frighteningly often.
Face it, folks, the market can't surivive without your support. Atari
Corp. has produced the lousy climate, but attitudes like this only make
it worse!

Again, what impetus is their for me to write more free software, much
less commerical software? It used to be that I did it for fun and that
I thought I might be able to pay some of my rent with shareware
payments every once in a while. It's no longer fun (the machines are
SO slow now in comparision to other things I've worked on), and no one
cares anymore. Talk about defeatist attitudes -- it's clear from your
tone that you DON'T care what happens to Atari developers and Atari
users provided YOU'RE happy. It once again blows the theory that the
Atari community is wonderfully supportive.

> The point I was raising was why do we in this news group always go
> throught this "Convience me to stay with Atari" every few months.

Because Atari's line of computers sucks by current standards, so
people rightly feel that putting more money into them might not
be such a great idea.

> If you care to read the posts I refered to you would see that his
> mind is made up already.

I've been reading Chris's messages closely. All the asked was why he
shouldn't jump ship? There was a time when you guys could have
answered that without name calling and leaping into defensive mode.
But then, there are fewer factual reasons to stick with Atari than
there were before.

> work with my other cards etc etc .

You are totally uninformed. Let's get one thing straight: you cannot
just make random stuff up to win the argument. That's called "fabricating
data," and it's cheating. So cut it out.

Those of us who OWN 80x86 machines know that you don't "void the
warranty" when you open the case. That is an ATARI concept. I got my
machine from Gateway 2000, and not only do I not "void the warranty" by
putting in a card, but they'll actually COME TO MY HOUSE to INSTALL MY
CARDS FOR ME if I'm too much of a loser to do it myself. This on-site
service came with my 486 machine for free. It's called ... end user
support. Imagine (snicker) Atari doing that.

As for hassles, sometimes it's a pain getting the IRQ and interrupt
numbers right, but it never takes as long as it would to SOLDER
SOMETHING INTO YOUR ST OR FALCON, and it certainly doesn't require any
engineering experience. It's truly amazing that you'll even TRY to
claim that these two activities are similar in difficulty.

Another word about user support: The Maxtor hard drive in my PC
went bad a few months after I first got my system. (BTW, it was
a SCSI drive you could attach to your ST, so don't bother trying
to blame the failure on the Evil MS-DOS world, OK?) Anyway,
I called Gateway and they (get this) *sent me a new one that day.*
I just had to take the old one out and swap in the new one, then
send the old one back. Free. Under warranty. AND I HAD OPENED
THE CASE BEFORE!

See, that's the kind of user support that people in the Real World
expect these days. On-site service, a tech support line where people
actually answer, good trade-up and return policies. Atari has never
done any of that; they seem to be incapable of it. That's one reason I
think Atari should make game consoles instead of home computers.

> Just like the ST, except very few ST's applications are inside the case.
^^^^^^^^^^^^^^^^

Ooo boy. I can feel the universe warping around you.

587. bug in gnu libs PL 85 ?

Newsgroup: comp.sys.atari.st
Date: 1993-01-12 15:13:32 UTC
From: Frank.Moehle@arbi.informatik.uni-oldenburg.de
Message-ID: <1993Jan12.152127.27821@arbi.Informatik.Uni-Oldenburg.DE>
Source record: 212333

hello,

I have the following configuration :

Atari ST with 8 Mhz, 2.5 MB Ram, Tos 1.4, 85 MB HD,
and GCC 2.3.1 and the GNU libraries PL 85.
Recently, i found out something strange :
I have a program that allocated a lot of memory using "malloc",
but "free" won't free these blocks!
I re-compiled my sources with PureC, and everything was fine.
Also, adding the following lines to the top of my sources works :

```
#include <osbind.h>
#define malloc Malloc
#define free Mfree
```

This way, I`m using the GEMDOS routines for memory allocation.

Frank.

Yes.
> 2. Is the internal SCSI disk accesssible by the Mac?
No, not yet, 3.0 only supports ACSI drives. Should be supported with 3.1,
if it is released at all.
> 3. Does anybody have a similar configuration who can report me about his or her

You're wrong. TT high (1280x960 b/w) on a 19" screen is fully supported by
Spectre 3.0 (that's my configuration, I ought toknow it :) .

> >2. Is the internal SCSI disk accesssible by the Mac?
>
> Yes. You just have to set up separate partitions for Atari and Mac use.
Don't mess up with SCSI and ACSI. Spectre does only recognise ACSI drives
connected via SCSI host adapter, but it cannot access the installed SCSI
drive.

> MSTE's internal floppy.

Working with floppies really is a problem with Spectre/TT, no matter if
with GCR or just Spectre disks. Some work, some don't. I dropped hope into this
and got a SyQuest for data exchange.

590. Message for Dave Evans!

Newsgroup: comp.sys.atari.st
Date: 1993-01-12 15:27:46 UTC
From: rzsbs@sbusol.rz.uni-sb.de
Message-ID: <1iuo1ilNNdl9@sbusol.rz.uni-sb.de>
Source record: 212332

I recently tried to send email to Dave Evans, devans@cix.compulink.com,
but this failed, so I will post it here. Perhaps somebody will forward it...

Hi Dave,

how are you?

I tried to install your port of KA9Q here on my STE4, but I was not lucky.
Me and the System manager of the comp center spent some time, we even installed
a spy to watch the serial line.

I use CoNnect (I also tried RUFUS) as terminal program. A Supra V32bis modem is
connected to the modem1 port, and everything works fine: I log in into my host,
start the slip program (it is an SCO server which handles connects to and from
outside university - X.25 and modems) and then start the net.ttp from within
the terminal program.
But: not any sign seems to pass through the AUX: port, the spy does not watch
anything!

Could you please mail me a config file which works on your site?

I try to install the serial port as follows:
```
---- /dev/c/net.rc -----------
ip addr [134.96.6.16]
attach asy AUX: 0 slip sl0 1024 512 9600
domain suffix uni-sb.de
domain addserver [134.96.7.7]
```

I also added /dev/c/domain.txt after inserting my ip address at the end.

What is wrong?

net.ttp does not send signs to AUX: if MiNT is installed or not, it doesn't
mind at all.

Any good idea???

greetings Bernhard

|> ... If you think I'M hard on your
|> Party Line, you should listen to what the Real World is saying.)

This is the scary part. The real world is saying NOTHING. Nobody cares, because the Atari market is almost flatlined,

A couple of months ago, I was ready to go out and plunk my money down on a Falcon. Instead of buying an SC1435, (maybe) a MegaSTE and Flight of the Intruder, I decided to sit tight. But now, because of the Falcon/MultiTOS delays, the price/performance ratio, and the software availability, I would say it's 50/50 between F030 and a 486.

I'm in no hurry anymore. I will wait and see. But if there is a manufacturing delay, they had better be taking advantage of it. (For the MegaSTE case, Multitos and software)

Atari is on the very edge of blowing themselves out of the computer market, forever. If they successfully kill of the ST user base, that's it. This is not 1985, when PC's were expensive, and Macs and Amigas were also new. (Though they might be able to hang on in video game consoles)

593. Re: What terminal program should I use to call a UNIX machine from my ST

Source record: 212331

UW, UW, UW, UW, UW, UW !!!!

I wonder, why uw hasn't been mentioned before.
It has up to 6 independent terminal gem windows whith various fonts
and sizes at once over one connection line, mouse copy/paste, window
selecting and cycling whith keyboard commands, etc.

Since I've tried it, I wouldn't want to work on a single-window
terminal prg anymore!

Of course, it also has it's drawbacks:

- uw - server has to be present on the unix host
- only ad31 - terminal emulation supported
- only kermit data-transfer, but running in the background concurrently
whith the terminal windows

the uw - package can be found on most major atari ftp sites.

I have no problems in mounting a Mac formatted SyQuest cartridge under
Spectre (connected to ACSI, of course). A normal hard disk drive should
work the same way.

598. Possibly fatal bug ?

Newsgroup: comp.sys.atari.st
Date: 1993-01-12 17:31:41 UTC
From: cfaehl@polaris.unm.edu
Message-ID: <1iuv9tINNad6@lynx.unm.edu>
Source record: 212341
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I just spent an unpleasant two days trying to fix my hard drive after it decided to go south. The story: playing with MiNT .95, running ICD 6.0.7 hard disk software. There's QuickST in the system, and that's it. I run Laser C (I use it as an editor), which hangs. No keyboard reset, the machine is gonzo down. I hit the reset switch, I get a BLACK SCREEN, then SuperBoot pops up, I continue, MiNT does not run and hangs the machine. And that's all she wrote, folks! My drive no longer boots. Can't recognize it when I run ICDBOOT from floppy. None of the utility programs I have even recognize that I had partitions on the thing.

Finally, I discover: the first 10 sectors of the drive are history. I get 6 bytes of 0a, then the rest is padded with 08. To abbreviate: only drive C was yonkered, I had to fill in partition information manually, and I had to recopy the 2nd fat on drive C to where the 1st should have been. CHKDSK tells me I have a few doubly-linked clusters now, and I recovered about 18 lost clusters, but I can live with that.

But I really really really don't want this to happen again. Does anyone have a CLUE why this might have happened? I'm not running MiNT until I can lay the blame at someone's feet. Thankx for your response.

cfaehl@polaris.unm.edu

There was a WEFAX program and interface published years ago in
ANTIC magazine. I have found nothing since. JVFAX50 for the msdos
machines is available at many ftp sites. It is much more sophisticated,
can use a simple interface, and better interfaces, built or in kit
form, are available at several places in Germany.

I have not yet used either program, but have received good reports on the
JVFAX program

I think it is very wise of C=. Then there will not be any way for programmers to crash when the chips are upgraded. Of course, this depends on good (and fast) support from the OS.

Anyone who has seen the box of GARBAGE that you get from Atari when
you become a developer should know that all developers have nothing
to start with when writing programs for the ST. The tools (C compiler,
assembler, resource editor) you get are the worst I've ever seen on
any computer. Game writers have no choice but to search through the
OS for tricks to use. I happen to think STOS is a great piece of
software. Take the line-A fiasco that Atari has created. All of a

sudden, Atari has said that routines we have been using for years are illegal and we have to use the vdi routines which are S**T (hence the existence of warp-9 and nvdi). If it wasn't for the MWC manual and the abacus books, I would still be in the dark about programming the ST. Developers are the most important resource a hardware vendor has and Atari has shown their developers absoultely no respect. No wonder Atari's programming 'rules' are being broken by programmer.

I will now step down off my soap box...

In article <1iv20tINN7m5@ub.d.umn.edu>, awest@ub.d.umn.edu (The Piano Man) writes:
>I was wondering where would be the best place to find an inexpensive modem
>for my 1040ST. I want to use it as a terminal to the minicomputer at my
>university. Anyone out there have one to sell?

Look for a V.32 9600 bps modem. MISCO sells them for about $370,
and I'm fairly sure you can get them cheaper by looking through an issue of
Computer Shopper or even a local 'free' paper. A 2400 bps modem should cost
you less than $100 brand new.

>Also, I would like some software that my five year old would
>enjoy...(educational and/or entertainment).

There are some excellant shareware programs available on atari.archive in the
../Games/Kids-games directory. My 2 year old enjoys sitting with me at the
computer and going through the Knowledge Vine's "House" program (kv_house.zoo).
Dorothy Brumleve's "Potato" program (potato.zoo) allows you to create a
figure from a variety of parts, similar to Mr. Potatohead. The Knowledge Vine
folks used to have a BBS where you could get programs. You might want to try
there as well.

If you don't have Internet access, send me some e-mail and we can talk about
getting you copies of the programs I have at home (all the stuff on
atari.archive plus other bits I've pulled from GEnie, etc.). Most of it is in
our user group's disk library.

606. on the need for 'virtual memory'

Newsgroup: comp.sys.atari.st
Date: 1993-01-12 19:02:11 UTC
From: davidli@simvax.labmed.umn.edu
Message-ID: <C0r8vp.683@news2.cis.umn.edu>
Source record: 212348

Can someone who knows the history of UNIX please comment on whether the early versions of UNIX 'required' virtual memory in order to work? My own impressions are that the PDP computers didn't have any virtual memory, and that most programs that were larger than memory consisted of a series of intelligent overlays. (My impression is partially formed by experience with UNIX 7.0 on a PDP-11/34, requiring a grand total of 10 megabytes of hard disk space, and the fact that one of the selling points of the VAX series of computers was the fact that they had virtual address space.)

Got hardware and software you don't use anymore?

------======<<<<<<((((( )))))>>>>>>======------

Got enough money that you can afford to be generous
with that which others can put to good use?

------======<<<<<<((((( )))))>>>>>>======------

I am co-chairman of the "PTF Education Committee" (PTF is
Parent-Teacher-Fellowship) for a private, non-profit, Christian elementary/
middle school in Cedar Rapids, Iowa. We have three known-to-be-working Apples
and one IBM PC. We also have some misc. stuff that has recently been donated
by people that read this newsgroup. The school's name is Isaac Newton
Christian Academy. Money is tight, and the roof needs repair, so usually
fund raising tends to be directed towards things other than computers. :-(

We are, right now, working on establishing a "Computer Lab", and have
been soliciting donations.

We ask that if you have ANY Apple, Atari ST, Amiga or MS-DOS
hardware/ software items, partial systems, or complete systems, you
would SERIOUSLY consider donating these to our school. Even if it is an
item that needs repair, we'd be happy to accept it IF we know the
repair costs involved before it is
shipped to us.

Even though we will appreciate any donation, here are some specific
things we are looking for at this time:

o EGA graphics monitor for an IBM XT
o WordPerfect 4.2 for an IBM PC
o Educational software for an IBM PC
o Additional IBM PC's
o Color monitor for an Apple II+
o Educational software for an Apple II+, IIe or //c
o Typing Tutor III for Apple II or IBM PC
o Amiga 500 Systems
o Atari ST Systems
o Power Supply for the original Commodore C-64

REMEMBER... this is a BONA FIDE non-profit organization!

Thank you for your consideration and support,
```

608. Flight of the Intruder / MegaSTE problem

Newsgroup: comp.sys.atari.st
Date: 1993-01-12 19:17:00 UTC
From: jsa@rcinet
Message-ID: <12JAN199314171518@rcinet>
Source record: 212349

Has anyone else with a MegaSTE run into a problem with Spectrum Holobyte's Flight of the Intruder simulator/game? I sent Email to HOLOBYTE on GEnie concerning this, but I've heard how much Spectrum Holobyte cares about supporting atari these days, so I better not hold my breath...

My setup is a Mega4STE with TOS v. 2.06, 50Meg internal Seagate IDE, 85Meg external Seagate SCSI (ICD host), and 88Meg Syquest (also SCSI). I know the software works fine on my "old" 1040ST, even off of the external hard drive. But whenever I run it on the MegaSTE, the screen goes blank right after I enter the correct password from the documentation. And the drive a: floppy light goes on, as if it's accessing that drive. I have tried this with both game disks in the drive (no, not both at once 8^>), but to no avail. I have also removed all accessories and the AUTO folder, so I can't see where something else is interfering (no TSR's). I have tried to run from drive E: (IDE), drive H: (SCSI), and drive A: (floppy). Still N.G. And when I try to boot from the floppy, I get 4 bombs. Out of desperation, I have unplugged my MIDI cables and kept my DeskJet powered off, but there is no difference in the result. Does anyone out there have any idea what gives?? The manual explicitly says that the program will run on a MegaSTE... (just not _my_ Mega STE... B^0)

Source record: 212350

I do think that piracy is more pervasive on pc's. Every person I know who has a pc has pirated commercial programs. I've seen pirated versions of commercial programs used by companies I've worked for. My brother used to work for a large aerospace firm and a friend of his there came very close to being fired because he refused to use pirate software at work, which pissed his supervisor off bad. I detect the attitude among pc owners that I know that they are "entitled" to pirate copies and you would be "stupid" to buy it. Do I hang out with an atypical, criminal set of people? I don't think so. I think they reflect the views of the average pc user.

I think the commercial piracy situation has gotten better since software manufacturers have started raiding corporations.

Now I don't know about shareware - I am talking about pirated commercial software, not shareware.

>anything unfamiliar to an Atari developer when you talk about not
>having money.

Overinvested in hardware, Dave? I hardly think this holds for most current owners of ST/STe machines. Four years ago I bought my 520STFM for less than $400. What kind of MS-DOS clone could I have gotten for $400?

I will of course agree that the price/performance ratio has been lost by Atari lately, when it comes to comparisons with MS-DOS machines, but I don't think it's an utter waste of money to buy Atari computers -- there are still plenty of things you can do very well with them, and the software just keeps getting better. If you need me to enumerate those I'd be happy to, but anyone who's been keeping up with Atari software lately knows there are some very good products out there.

Would I like to have better graphics and a faster computer? Of course, anyone would. That's the main reason I'm going to get a Falcon030 -- it represents a newer, better version of a computer I've used for years. Contrary to what Dave has been saying, I don't think the Atari OS is seriously "flawed" or unworkable for programmers/developers. I would agree that Atari should get their act together as far as marketing/support goes, but to me this isn't the primary reason why I buy a computer. I know how to use a lot of different systems (MS-DOS, UNIX, Mac, etc.) and the one I like the most is still my Atari. We've been through all this before -- if you know what your computer can and can't do, and you're satisfied with that, then that's great. For me, the Falcon030 represents a viable choice for my next computer, and I have no plans on switching to anything else (well, except maybe a TT :-).

611. Help with 'Life and Death'

Newsgroup: comp.sys.atari.st
Date: 1993-01-12 20:20:58 UTC
From: snoret@egon.unx.sas.com
Message-ID: <C0rCIz.1Fo@unx.sas.com>
Source record: 212202

Well, taking a break from the recent flamefests that have plagued c.s.a.st, I've decided to give one of my more recent game/simulation purchases another try. Here's the deal:

I have the game/simulation 'Life and Death'. You know, the surgery sim that let's you poke around in someone's insides. The docs are not spectacular, emphasizing the atmosphere of the simulation more so than how to actually use the mouse to do things. (i.e. detailed descriptions in medical terms, but no clues as to what it's supposed to look like on screen)

Anyway, has anyone successfully removed an appendix?! I can get the appendix out of the abdomen, but as soon as I try to clip the blood vessel (which I have no idea where on the appendix it is) like it says in the procedures, I cut into the appendix and kill the patient.

ANY help would be most appreciated!! Thanks for listening!

Well, I've moved up to a Powerbook 100, and I have to say it it is
a great improvement. I bought it brand new for $700 with the external FDHD.
System 7 is tons better than GEM, and I also can get educational discounts.

I agree that software is expensive, but it depends on what you want
to do. Microsoft Works or ClarisWorks are both very good intergrated
programs, and only cost ~$150. (I haven't priced them lately.)

I'm sorry to say I will probably never buy anything new from Atari
again. (Although I still like my 1040ST, it hasn't been turned on in over a
month.)

Well not wanting to get into a flame war with you Dave or anyone in
paticular, but do you not think this in itself is a defeatist attitude?

I personally do not mind if you will or will not write software for me
as a user, as I have all the software I need and it consists of only
a few packages these days.

You see I became thanks to my Atari a multi platform user. I have
various things I do on each but they all relate to telecommunications.
This site started as a MBBS system and out grew it in a few short years
and now is a mixture of machines and os's.

The point I was raising was why do we in this news group always go
throught this "Convience me to stay with Atari" every few months.
If you care to read the posts I refered to you would see that his
mind is made up already. So frankly Dave why should we bother to
waste the bandwith answering him?

I am amused to hear that I am a rabid supporter.

>[stuff deleted]
Actually I did not say "Take off, we don't need you"

I said, quoted from above:

>>> Why doncha buy a nice Mac and **** off ? If you need convincing the Atari
>>> is wrong for you.

Let's analyze this quote in a bit more detail...

0) We can see that there are actually TWO sentences, not just one.

1.
a) It sez that the guy who asked for help should NOT buy an Atari, but
buy a *nice* Macintosh computer. This clearly indicates, what I would be
advising a guy in the states, which is don't buy a ST.

b) "and **** off" (since they are '*' and not '?' this needn't neccessary
be a fourletter word (although it was meant to be))
clearly sez, that I am really tired of reading this thread (and related
threads) that fill up c.s.a.s for weeks now. If the guy wanted to make

me happy he'd stop posting is boring ****. (articles)

2) The second sentence has two possible meanings

a) If you still need to be convinced, I am telling you now "The Atari is wrong for you" (not intended, but not so bad actually (har), which amounts to emphasizing the previous sentence.

b) If you aren't convinced that the Atari is the right choice for you, than it isn't the right choice for you. (intended)

Which in 20 words or less, is exactly my opinion.

Nat!
[lengthy statement follows for clarification, for those who haven't got it yet]

I am still (maybe a few weeks still) at a university where I actually use daily, a HP-Workstation a Symbolics Workstation and a Sun Sparc 10 workstation (and I am not writing "hello_world.c" on them either, so I don't know them just superficially), I am certain that I wouldn't trade my ST with the software I have for any of those, if I had to only choose one computer (I'd take the Sun anytime so as an additional one).
I know the Mac from my ex-girlfriend, and the PCs from various friends, and whenever I work on them (as I did last time a weekend a few weeks ago trying to port my assembler using TC++) I wish I was back at the ST. As long as the PC runs MSDOS at all, I am staying away from it. The Mac isn't so bad, it's not that I actually like the system, but it has its charm and I could live with it.

Not that this isn't likely to change, as soon as I see something on another machine, which I think is such a step ahead, that I need to participate (like the step from the 800 to ST) I'll dive in head first.

Unfortunately there is NOTHING on the market yet, that fits the bill.
I sure won't buy a PC with a beta-test OS version, much less with a UNIX clone. Even this Sun here doesn't run stable and the software is definetely not beta anymore! (I couldn't afford a color Sun anyway (sniff))

On the ST I have a wordprocessor, "Tempus Word", where I ain't missing anything, I have the software tools that I favor (Pure-C & Tempus) and the programming environment (GULAM+unix tools), which I need.
Sure I could use a bit more speed and diskspace, but that's not enough reason to junk the stuff I got (and am used to). The (projected) F040, if it comes out, is exactly the machine I am looking for.

Conclusion, I own an Atari I am not blind to see what the others offer yet I still don't see anything I'd like/need to switch to, since I am absolutlely content with my setup. If on the other hand someone was NOT "convinced" that what he has fits what he needs, than there is no reason why one should NOW buy an Atari. When the Falcon line appears that of course changes.

Well maybe one reason, the TT could be cheap now.

Nat!
P.S. Again I have been suckered into a flamewar. Next (of my) flamestuff by
Email (promised). Replies, if you want them answered please by Email
too.

617. Gray-scale on TT, low-rez??

Newsgroup: comp.sys.atari.st
Date: 1993-01-12 22:01:01 UTC
From: paul@jupiter.ame.arizona.edu
Message-ID: <1993Jan12.150102.4239@arizona.edu>
Source record: 212206

A while back, some were talking about doing gray scales in TT Low-rez (256 colors). I experimented with this and found many shades of gray, but I couldn't figure out exactly how the red-green-blue values in a setcolor statement affected the shade (this is, of course, with the colors set to "Gray" on the control panel).

Does anyone know specifically how this works?

Thanks!

>Well, sure, but sounds like a small market to me. I think it seemed like
>a double-edged sword, hurt Atari and make money doing it. :-}

long winded message from the Evil One below...

You're both right! I'm evil wicked mean and nasty and I do it for the money.
But since you're thinking deep thoughts here, why don't you think about
this:

About 10% of the price of a Gemulator package goes to Atari Corporation
for the TOS licence. Considering that their real ST sales are currently
between dismal and pathetic, the extra income from the TOS ROMs may help
push Atari into new areas of profitability!
Although I can't see their profit on a real ST (say, a 1040STE with a
dealer price of about $250) being much higher! They actually might be
making more money each time a Gemulator is sold, although I don't know
their exact profit margins on their hardware.

For 3 years I worked on and sold Quick ST, a product which actually helped
sell ST (or at least kept people from buying a faster machine). About a
year when I no longer had enough time to keep supporting Quick ST, I could
have:
a) deep six the whole product so it is never heard from again, or,
b) sell it to the one company that had enough technical knowledge
to keep maintaining and improving it (i.e. Codehead).
I chose b), which puts a dent in the "evil mean and nasty" argument.

But on the other hand, , parts of Quick ST are integrated into
Gemulator and the upcoming Gemulator 2.1 update will be bundled with
a special version of it, thus improving the speed and making it more
attractive to buy Gemulator. More points for the "evil mean and nasty"
argument.

But on the other hand again, it has been argued that Gemulator helps
ST developers. After all, who will buy Atari software when it's almost
impossible to buy Atari hardware! There are so few dealers left and
stretched so thin that for the typical computer user it's a hell of a
lot easier to just buy a PC. And PCs are cheaper too. But of course
I have a strong motivation to make people buy PCs.

Enough deep thoughs.

The original reasons I wrote Gemulator are very simple: 2 years ago people on bulletin boards and online services started talking along the lines of "gee, wouldn't it be cool to run ST stuff on a PC" and "gee Darek, you wrote the 8-bit emulator, how about an ST emulator". I thought about it for a few months, ported over ST Xformer to the PC as an experiment, saw that it could be done, and said "sure, I'll do it". Besides, it would be an excellent way to piss off Atari!!!! <- main motivation and because hey, it's a cool project! <- second biggest motivation

If you remember back two years, the original plan was to release Gemulator as a public domain program by having it use disk based versions of TOS. Why public domain? See the two reasons above. Money had nothing to do with it.

Then Atari stepped in and said "no way, you can't do that" (they said the same thing about ST Xformer 5 years earlier, and this time they wouldn't budge). So thus was born the idea to use a hardware based card in much the same way that Spectre and Magic Sac work. Hardware costs money to produce and thus the public domain idea was shot to hell. By the time the Glendale show rolled around last September, I was over $30,000 in the hole buying PCs, making boards, buying ROMs, etc. That's why Gemulator costs $299.95, because about half of what I charge dealers for it goes to cover my costs of the hardware and ROMs. If the hardware was cheaper then I'd be charging less, and actually that's already happened because my per-board manufacturing cost is slowly dropping as I make more and more of them. Expect an under $200 Gemulator package VERY SOON.

So there you have it. I'm not all that mean and nasty. I'm not getting terribly rich off the product. Less that 500 of them have been sold so far, but that's mostly in North America where most people have already fled the Atari scene. The German, French, and U.K. versions of Gemulator just started shipping. But I am having a lot of fun with it and so are most of the 500 or users of it. If someone reading this is upset at me for doing it, well, tough. Go bark up another tree.

See, there are logical reasons for why things are the way they are.

- Darek

619. Help fix the Info-Atari8/16 Digests

Newsgroup: comp.sys.atari.st
Date: 1993-01-12 22:43:05 UTC
From: aa700@cleveland.Freenet.Edu
Message-ID: <1ivhhpINNoik@usenet.INS.CWRU.Edu>
Source record: 212207
Cross-posted to: comp.sys.atari.8bit,comp.sys.atari.st

As many of you should already know, Usenet's comp.sys.atari.8bit and comp.sys.atari.st have alternate identities as the Internet mailing-lists Info-Atari8 Digest and Info-Atari16 Digest. Every posting on the Usenet side appears on the Internet side. Problem: Any posting sent to the Internet mail-list is NOT cross-posted to the Usenet side.

John Dunning, jrd@stony-brook.scrc.symbolics.com, and maintainer of the Info-Atari8/16 Digests, would like to fix the digestifer software to cross-post in both directions. The following is from him:

>
[The digestifier is] a C program and a bunch of shell scripts. Most of the interesting work is done in the program, the shell scripts are mostly there to decide when to run the program, and shovel things from the news directories into mail format, which the digestifier wants. There are a couple of stupid little programs that I wrote to aid in the process.

There are two big problems in all this: When news messages are received, they need to be sent through something that will mail them to the digestifier program. That happens completely parasitically now, and it's a kludge. The other thing that's necessary (which I've never been able to figure out how to do) is to go the other way, ie mail received *from outside* for the digestifier gets sent to the news sender. You need to be careful in a couple of places to prevent loops.

If you can scare up some folks who know enough about this kind thing to get it working, I (and the rest of the list, I suspect) will be eternally grateful.
>
End quoting from John Dunning.

Again, contact jrd@stony-brook.scrc.symbolics.com if you can help. I would imagine the participants of comp.sys.atari.8bit, comp.sys.atari.st, the Info-Atari8 Digest and the Info-Atari16 Digest would be very grateful indeed.

Sorry, but anyone who says Flash is a piece of junk is either blind
or an a**hole. Flash (1.6) is a great program, the only thing Uniterm
has over it is slightly better vt102 emulation and Tek mode (whoopee).
Flash has a fully editable capture buffer with word wrap, builtin CIS B
protocol, etc. IMO, STalker is much worse than either Flash 1.6 or Uniterm.
Anyway, it's almost meaningless to sum up a term program in one word
like "better" than another term program.

Chris, did your read the BIG GRIN when you went into defensive mode ?
Well I use OS/2 version 2.0 and the beta2.1(windows 3.1 fix) here and
from what I have seen from your posts you are in for one hell of a
suprise.

Forget OS/2 think Windows MT! and you will have an ST in an clone box.

Ps: do a search on GEnie under "kiwi" on 475,3 ...
But I do not get defensive (grin).

Well it goes both ways. To change cards on the PC you muST remove the
case, there goes the warranty and insert the card. Now comes all the
hassel like, will it work with OS2, is there a driver for it, will it
work with my other cards etc etc .

Just like the ST, except very few ST's applications are inside the case.

Re best for your price. Hey Chris this applies to ALL machines and well
you know it. A case in point. The async driver/card for the AS400 here
costs $nzd1200 but hey a clone costs $nzd800. So do I get the best or
a clone and there is only one made by Big Blue? Har far do we take this?

How about this? I know a HELUVA lot of people who use the PC line and when
the come over to my house and see the pile of BOUGHT software I have for my
STE will express _disbelief_!!! (Something along the lines of "You actually
BUY software????") Hey, believe it or not, piracy is far more rampant
in the PC line than in any other line. So don't give me crap about PROVING
it and all, cuz _hey_ I own all three Amiga, ST, and PC, and I have actually
seen PIRATED software in original-looking boxes being taken off PC shelves!!
Tell me if this is widespread in any other market...("Hey, you need Windows?
Just take it of my computer, man..." <--- what more did you expect from a
company which didn't know how to copyright???)

Just like you tell us not to hide shit about the ST, please don't hide shit
about the PC's.....Jeez.

For those who don't know, you don't run OS's off a CD-ROM. The CD-ROM is
only for installation purposes - it's like a tape, but cheaper to produce.
One reason WHY you don't is that a CD-ROM is WAY to slow.

>Precisely why I'm trying to collect as much info as possible...

Check the availability of GNU software, especially GCC/G++ on the PC and Mac
platforms. Under Linux, YES, under DOS, NOT REALLY.

> Question: Can this FZ354 be fixed with jumpers or is it time to
> call TEAC for a replacement?
>If you need any further info, like how I have the jumpers set, say
>so.

There is just a switch that needs to be set. It tells the drive in which
mode to report disk change in.

1. It just changes the state of disk change if a disk is put in or out,
ie. if it was 1 and you remove/insert a disk it is set to 0.

2. The state of the disk change signal is the direct status if a disk
is in or out, ie. if a disk is in the drive the disk change signal is
1 (or vice versa).

Hope this helps.

628. ADVOCACY: Falcon - Why I'm buying it...

Newsgroup: comp.sys.atari.st
Date: 1993-01-13 00:30:30 UTC
From: alrashi@ecf.toronto.edu
Message-ID: <C0ro2w.Gtu@ecf.toronto.edu>
Source record: 212213

To all who give a crap,
Jeeez, what a bunch of killjoys!! What makes you think that just because the Falcon does not fit the exact specs that you _need_ to run "non-existent" software, that its a piece of shit?? (pardon the language - it's been a long day, and I'm pissed...) Lets put this in perspective...

1) The Falcon is not (contrary to most views) a useless computer. Why? Keep reading.... For one thing, the sampling equipment on the thing is incredible for the price. I guess most of you are just either not into music or are just plain ignoring this facet in the Falcon's capabilities. Music is also damn hard to make (with all the reference to all the programming) and I mean good music (a SUBJECTIVE quality - as is the quality of games). Back to the sampling thing...I know of at least three samplers in the CDN $2000-$3000 range that offer the SAME amount of quality and hook-ups (in/outs) but DON'T have the ability to do editing and sound effects (limited in most cases). The Falcon however is an open-ended sampler !ight here, having a Falcon is a good deal already.
2) Okay, how about the graphics? Not all too great..But look at the PC market.. Sure there are lots of incredible graphic cards, but who actually gets them? And for what reason? (I've asked! And the usual answer boils down to - showing off...) Hey, showing off is great, but I'm not shelling out for a damn show case machine!! Hey, I don't see THAT much complaining about VGA... Now, I'm not offering excuses here...to be sure I'm going to more or less trade in my F030 for a 24 bit color F040 when it comes out.. All I'm saying is that this seems to be a case of never getting enough to me.... I can just see it, as soon as the F040 comes out, people are gonna bitch about it! Hey, you've all been screaming at Atari for a better computer and now it comes out, you're all yelling and screaming that its too late...So fucking what? Did you need it to save your kid or something?? If it pisses you off so much that Atari is disorganized, why not we all send a group letter to 'em. Why the hell do you have to slander a good computer?
3) Sound, graphics..what else is there? Software is what. Hey, I'm not sure if everyone knows this, but companies are producing for the Falcon! (NEW companies too, for christ sake!) So if you please just keep your pants on, the damn software will come out when the computer hits the mass market! And so what if it doesn't, you say? Well, shit, I still have a damn good sampler!!!! Also whats all this about the Atari being dead in the music scene? Hey, if you didn't already know, the States isn't the only fucking country on Earth, eh? Hey I feel for you if you can't get what you want, but tough shit, thats life...you want it, you gotta wait. Me? Emagic's gotta direct retailer around the corner, so don't give me shit about there being no sequencers. As for IBM sequencer's, what the crap did you think I had before I got my ST? I only got my 1040ST in Dec 1991, and Jesus, when I ran Cubase I almost fainted...Compared to the IBM sequencer, (Expletives deleted)..Suffice to say it was much better. Even the sequencers now days are nothing compared... Only

the Mac is as good, but hey, most struggling musicians are not rolling in cash!

Boy that felt good...
Anyway more later.
BTW, I'm sick of supporting the other side of the argument. I know you guys
will do it for me....

AcEzE.

I've heard it mentioned a few times that the LineA interface is not Kosher programming. Since when? I've written heaps of programs that use LineA, and they work even on the TT. Is the Falcon eliminating LineA? I doubt it, since compatibility would drop to about 10% !!

Or is it just the UNDOCUMENTED negative LineA offset values?

Hello, Dave. I hope this doesn't sound like deja vu.. d:^)

I'm curious what "rules" there are on the ST!? Please tell me because
Atari certainly hasn't. Or should I spend my yearly allowance and
become a registered developer? The Developers Kit certainly shows how
much Atari cares. Maybe Atari should publish tutorials like CBM instead
of leaving it to Abacus...

I've never programmed with STOS (after all, I have dignity), but from
what I've seen of it, it seems unlikely that they could have used Line-A
calls, no? Face it, the OS does not have adequate graphics functions! You
aren't going to produce a polished *_SMOOTH_* running game under VDI.
Sure, go out and buy a '486/66 and write your games for it! It seems
contradictory that you are touting the PC when 99.9% of the games for
that machine go straight to the hardware. Demo coders have proven that
there are still some things that can be done with the ST hardware and
it's up to the game developers to catch up.

>>Particularly if they are not even aware of the these new machines etc

Yeah.. By not releasing 68020/68030 machines until recently, eh? Well, I'll
tell you that it's common knowledge the mistakes that Atari has made in
the original ST computers that has made it compatability difficult.
Remember who wrote TOS 1.0?

>
>>Maybe you would prefer it if the games were a little slower or a little less

>to follow the rules, but doing so did not affect efficiency any.

Maybe you should compare your Game Workbench productions to games written with "illegal" means? Does Game Workbench have support routines that do fine virtual (or token map) scrolling in 1 frame? I'm not even talking about sync scrolling (heavens!).. I'd be very impressed if you could show me a game with the same polish and smooth execution that is seen in a Bitmap Bros. games or even Delta Force games (in Syntax Terror & Punish Your Machine demos).

Do you honestly believe that your ST or STe sound routines will survive upwardly compatable forever? Is there even OS support for the STe DMA?

>points of the VAX series of computers was the fact that they had virtual
>address space.)

Your impressions are accurate; it was even a big deal when the 11/34A
came out because it could split instruction and data space for a grand
total of 128K of per-process memory. My DEC Pro-350 (11/34 class)
running VENIX 1.0 (V7-like UNIX clone) lets you use more than 64K per
process only by mapping pages of memory on a user-controlled basis
(The C library will do it for you if you use some compilation
switches) with a special OS call.

Why's this in comp.sys.atari.st? Getting frustrated with trying to
compile 600 meg source files with GCC under MiNT? (1/2 :-))

Cheers,
entropy

No. APPLE foces you into using there hardware. SCSI, RS-232, Centronics -
all are supported [SCSI not on ST/STe, but they're old, and - like PC's -
require an extra host adaptor].

Anyone considering an Apple should look very carefully at this Apple attitude.
SCSI-yes. The rest-no. Even all the cabling is non-standard, and quite
expensive. The Apple StyleWriter is basically just a Canon BJ10e, but costs
more, and can't be used on anything but an Apple.

Even the Modem port requires an Apple modem... since it is RS-432 [or something
like that - not RS-232].

Apple was my "next choice" at one time, but now NO WAY. Especially now, with
the lack of GNU support.

Is this done at the hardware level?? Meaning if I select OCS at bootup
and set bit 6 of bplcon0, would the Amiga <STILL> kick into SuperHires
mode? I don't own an A1200 so I don't know.

>on good (and fast) support from the OS.

It doesn't matter whether the hardware manual is published or not, people
will still get the information by disassembling the libraries. You know
this! Isn't it smarter for the information to come from Commodore?
Whether Commodore or Abacus publishes the definitive hardware reference
manual, it's completely up to Commodore.

Personally, I have a better idea of how Commodore should upgrade the
Amiga's video hardware next time.. LEAVE IT AS IT IS!! Create a completely
new set of custom chip registers and modes independant of the old design.
The original chipset architecture is practically topped out with the new
AGA modes so why bother? The design of the AGA is roughly akin to Intel
32-bit architecture in that the same basic design was updated. It seems
to work for the Falcon, anyway.

OK, one more clarification: *Microsoft's* MS-DOS was packaged *by IBM*
with every PC ever sold until the clone market kicked in. So YES, I
suppose TECHNICALLY SPEAKING there's no IBM CLI. But there is an
IBM-endorsed standard. (Not that IBM matters anymore.) There is (once
again) no Atari-endorsed CLI for the ST. OK?!

>As for "wimp" interfaces, would not OS/2 and Windows then be
>considered as well? (being non-CLI?).

OS/2 runs DOS better than DOS, but sure Windows is WIMPy, and it sucks
eggs (sorry David) too. I don't use it. I detest it. Feh!

>And those are the main selling points for the PC's right now

Windows? Selling point? Hah! The main selling point is that you get
a hell of a fast machine for your money. If you really want an OS
get 386 MACH or something.

>>Second, the ST doesn't run Unix. It can't run Unix because it isn't
>>capable of doing virutal memory. (It does run Minix, though; I'll

>
> Dave, could you give me a short description of virtual memory and
>what it takes to do it? I assume (correct me if wrong) that the Windows
>SWAP file would be considered virtual memory? Why would doing something
>like that not be capable on an Atari? Just curious.

Coming right up: "Virtual memory" generaly refers to memory (for code
or data) that may or may not have a physical counterpart in the machine.
Under Unix (which has virtual memory), processes can allocate as much
memory as they want to (almost). When you allocate more memory than
there is in the machine, proceses get "swapped out" to disk. In other
words, pages of memory get saved to disk and marked as "swapped." When
a process tries to access a swapped page, a "page fault" occurs, which
is similar to an exception on the ST (e.g., two bombs). The reason
you need hardware support is that you have to check to see whether
your page is swapped it *at every memory reference*. This is hideously
slow without hardware support.

Windows does do VM, and Windows NT probably uses VM even more. But
Windows doesn't run 80x86 chips that don't support virtual memory.
The 8086, the 68000's counterpart, doesn't have virtual memory support.

The 286 does, but in a very limited and brain-damaged way. The 386 does (for real), which is why Windows is recommended for 386 systems and better, and why MACH runs on 386's and better.

Software virtual memory schemes are possible but generally lose due to slowness or required brain-damage. The original Macintosh OS implemented a software virtual memory scheme, which is where the 32K per code segment limitation came from (which was subsequently inherited by Megamax C version 1.x, BTW).

The TT and Falcon, BTW, CAN do VM, because the 68020 and 68030 handle VM quite well.

> Depends if you could use the software. Something like Game Workbench
>would seem like a great thing for game programmers.

Your point is well taken, but that was intended to be an example. How about the world's greatest DTP system? I'd think that would be about $300 a copy if it were something as good as Interleaf, Frame maker, etc.

>>An early, buggy version of a poorly designed single-tasking OS.

They don't *have* to be so lazy. The information is out there; you just have to look a bit. I'm not saying game programmers suck, or STOS sucks either. I'm just saying that all the things that don't work on STe's, TT's, Falcon's, etc., COULD have been written to work fine ahead of time without impacting the speed. I know because I've been part of a project that's very much along those lines. And yes, it was more work, but it was time well-spent, IMHO.

>Developers are the most important resource a hardware vendor has and
>Atari has shown their developers absoultely no respect. No wonder
>Atari's programming 'rules' are being broken by programmer.

I'm not going to disagree with that at all. Atari made mistakes regarding their dissemination of information to developers. But the situation is not so bad that you're forced to break the rules.

I detect that attitude among ST people. I don't think PC pirating is
worse or better than on the ST. I think they're about equal. It's a
matter of psychology, not computer hardware. I don't see why anyone
would expect things to be different for any reason other than
demographics. (I.e., Atari owners have less money so they pirate
more.) Note that I'm not saying that statement is true; it's merely an
example of a prediction based on demographics that could be tested.

I totally agree. It seems to me that the Falcon030 is optimized for music
music music. With some converters and software it will operate just like
a $2000 dedicated sampler. I don't know if anyone is writing this software,
but I DO know that Digital FX (the company the owns Hybrid Arts) is working
on a Falcon version of their direct to disk recording software. To do that on a
Mac requires aa $1000 Audiomedia][card which is not as flexible. In addition,
the Falcon will do real-time digital effects. A dedicated effects box could
cost $500-$1000 easily. The Falcon also has built-in MIDI ports.
To tell you the truth, I just ordered a Macintosh, because don't see the
Falcon as a good main computer. If I get a Falcon, I will view it as an
impotant addition to my musical gear and a game machine. I'm not going to
use it for spreadsheets.

Actually, there are a lot of third party companies making hardware that works
with Macintosh computers. I've seen many different non-apple moniters, modems,
printers, and scanners for the Macintosh.

>become a registered developer? The Developers Kit certainly shows how
>much Atari cares. Maybe Atari should publish tutorials like CBM instead
>of leaving it to Abacus...

Like I said elsewhere, I'm not about to claim that Atari did a good job w.r.t. getting the "rules" out there, but there are plenty of obvious rules of thumb that common sense dictates. E.g.,:

1. Your program should run from hard drives, not just drive A
2. You shouldn't write self-modifying code. Chips with instruction caches have been part of the Motorola line for years now, and to think Atari would never go beyond the 68000 is silly.
3. Relying on any global system variable which isn't in the Atari docs (also in the Megamax, Lattice, and MWC docs) is RIGHT OUT. There is NO reason to do this for games.
4. Assuming you own the whole machine is also bad. Again, anyone should have seen multitasking coming to the ST line; it's been around on personal computers since 1985 or so. Along with this are little things like not assuming the screen is at $78000.

None of these things is hard to figure out or dificult to follow. And games are pretty simple, really; they don't need to do much but play sounds and put images on the screen. There's no need to use undocumented traps or assume things about where the screen is in memory. Such practices are the product of ignorance or laziness.

(And though I said games are simple, I don't mean they're easy to write. The algorithms are straightforward; it's just that you have to spend a lot of time optimizing them.)

>Face it, the OS does not have adequate graphics functions!

Well I didn't mean that people whould write games using the VDI. Obviously assuming the screen memory layout is ST low rez is not so great in the long term, but that actually is an assumption you have to make to get decent performance on an 8 MHz ST. Given this, Atari has done the right thing in making sure this video mode has

been supported in all their machines.

You have to assume some things, of course, like the fact that if you put some data somewhere in memory, it'll be there when you come back to it. :) The point is that many of the assumptions made by game programmers have been unreasonable, and therefore losing.

>It seems contradictory that you are touting the PC when 99.9% of the
>games for that machine go straight to the hardware.

Doing graphics on the PC is difficult, but the situation is quite similar to the ST in terms of required assumptions. You have to assume a certain screen memory format (as well as where the screen is mapped into memory, of course, since the video ram is separated from the normal ram), but that's about it.

>Demo coders have proven that there are still some things that can be
>done with the ST hardware and it's up to the game developers to catch up.

While that's true, many times the demo techniques are inappropriate for games because they're too memory-intensive or demo-specific.

>Maybe you should compare your Game Workbench productions to games
>written with "illegal" means? Does Game Workbench have support routines
>that do fine virtual (or token map) scrolling in 1 frame?

You should really ask Neil about his scrolling routines. Send email to <neil@cs.heriot-watt.ac.uk>. BTW, you can most definitely do fine omni-directional scrolling with tokenized maps in 1 frame. Not only that, but GW will even compare sprite vs. map token priorities and over/underlap sprites and map tokens in real time if you want. (Did I mention the collision checking?) These are all things you can set right in the sprite editor -- you set the priority of each frame of a sprite and it just goes under and over things appropriately. Generalized, easy-to-use, works on all Atari machines. It can be done.

>I'd be very impressed if you
>could show me a game with the same polish and smooth execution that is
>seen in a Bitmap Bros. games or even Delta Force games (in Syntax Terror &
>Punish Your Machine demos).

As I've mentioned before, the Bitmap Brothers' scrolling routines are somewhat inferior if you really take a look at them. There are more sophisticated (but legal) techniques than they use. Again, ask Neil about it -- that's his specialty.

It really is too bad that Neil and I never wrote a scrolling game to show off GW. The scrolling code was only ready late in the project, and by that time I was devoting so much time to the system itself that I really had no time to spare on a scrolling game. (We have demos to test the thing, of course, but that's hardly what people would want to see.) It takes a lot more work to design a good scrolling game than it does to do pacman. And I'm a really terrible artist, and was unable to

find anyone willing to invest the 1000 or so hours to do all the
graphics for a freeware scroller.

>Do you honestly believe that your ST or STe sound routines will survive
>upwardly compatable forever? Is there even OS support for the STe DMA?

Yeah, as long as there's a PSG in the machine mapped to the same
locations in memory. There's nothing "unsupported" about the sample
playback routines. (They do work on the Falcon, by the way.) The only
fiddly bit is a movep instruction, and Atari has documented its abuse
in that case.

>-- DPZ

I have a friend that has an old 68k machine, which runs something called
IDRIS. It's a UNIX derivate from some *very* early version of BSD UNIX, or
maybe AT&T. It boots from a 360kb floppy disk and the machines memory is only
on 1MB I think (could be 512kB though), and it doesn't use any virtual memory.

So _my_ conclusion is that they probably didn't need virtual memory in the
start, but it was added as a feature later on. (RAM was pretty expensive back
then).

Although I may get rocks thrown at me...
I have been using DOS computers for years, and have built a career out of them.
I like IBM clones and DOS, but I am not blind to their weaknesses, some of
which Atari sts do not share. I own a DOS clone and an STe, and am quite
happy with each. Software availability is certainly weak for the ST, but
then again systems software for the IBM is limited. DOS is nice, but
has its limitations, Windows simply doesn't perform reliably, and OS/2
is limited in performance, software abvailability, and distribution.
(Personally, and I know more stones will be cast at me for writing this,
I'd prefer Unix as an upgrade to DOS, over Windows or OS/2), DOS did have
a chance to keep moving, but, thanx to Microscam, that never happened.
Lastly, my experience has been that TOS with GEM runs much more reliably
than DOS with Windows, for all the cool technological innovations that
Windows has (tried) to deliver, like DLLs.

Several times I have seen GEM criticized, here and elsewhere, somewhat unfairly. GEM is NOT an OS, first of all- it, like Windows is PART of an OS- they both provide some system level functions, most noticeablty the screen management, but do not run by themselves: hence, neither is an OS, nor an application. Since GEM is not an OS, it is neither multi-tasking nor single-tasking. Lastly, GEMs biggest problem always was Apple, which used legal means to suppress its economic rivals, unfairly, in my opinion. True, this does not change the current technological state of affairs, but at least the record should be set straight.

>Kosher programming. Since when? I've written heaps of programs that
>use LineA, and they work even on the TT. Is the Falcon eliminating
>LineA? I doubt it, since compatibility would drop to about 10% !!

Line A is supported only for ST compatible resolutions (I think in
practice it works on the TT compatible resolutions too, but I do
know that there are some Falcon resolutions for which it does *not*
work). In other words, if you want your program to run in any
resolution, or on any graphics card, use the VDI. Users will
appreciate this; I get very annoyed at programs that force me
to use the resolution *they* want, instead of the resolution *I*
want :-).

(This is particularly an issue for people with extended graphics
cards, such as the Matrix board, which also do not support line A).

Regards,
Eric

Well to add even more of my opinion to this...

First and foremost, Atari has to get the Falcon out the door. If they don't manage this in the next few months, they will have soundly established an effectively permanent reputation as the vapourware kings...

After hearing about the 3do I am excited about the possibilities of the DMA connected DSP. None of the other computers will have this for a few years yet and it doesn't sound like the 3do will come with a keyboard at first. Therefore, the Falcon may have an interesting edge...

If they just get the $%$$% computer out, it is clearly an excellent deal as a sampler. This is independent of any of its other uses and could provide it with a niche to survive if it otherwise stinks...

I am very intrigued by the 3do; there are now 3 choices for my next computer. Amiga, Falcon, or 3do. It's going to be a fun year and my pessimism has just abated because of the 3do... I finally have a choice beyond the orphans and the clones... So sorry PC people, I see no reason to buy one now... I'd rather bring the tools I want to a new exciting and advanced platform than rely on a dinosaur with a jet engine up its bum... I'd love to see one of those perform real-time texture mapping of incoming video data heh heh...

Scott - thank god the 90's just hit the computer industry

>without them.

I have to agree with that statement. I used to always say to the IBM
owners here that I didn't need a HD, my computer could run quite fine
without it. Once you get one, you'll _never_ turn back. The speedup
is so amazing. The first time you unlzh a file, you'll go 1/2 into
shock! I always thought it was the slow computer that caused that,
but it's definetly not (of course it only runs at about 1/2 the speed
of the 386 40mhz and greater machines thought, but it's only an 8mhz ST!)

As for programs for the ST thesedays, they're getting more & more complex,
and there's a lot out there now that simply won't run on anything less
that a few megs of ram & a HD.

Craig.

What's the "... ,round 117?" The OS still hasn't given me any problems (at
least none big enough I'd know where to attribute them to). And I don't think
it's likely I'll ever need 40 folders on a floppy. :) Also, for what I (and
many others) do there's not much reason for multi-tasking -- Unless I could get
my computer to take a wizz for me while I'm typing my research paper at 4:00
in the morning. :)

> having money.

I bought the most I could reasonably afford at the time. There's no way I could've gotten a respectable PC sytem at that time for that price. When I traded up to this (then-used) Mega ST4 (bought for me as a gift, mostly) it was again as much as i could afford. I figured, with the extra memory I could get by on the RAMdisk and play wait-and-see, for the next _real_ new computer, for a longer time. I was right.

And as far as waiting goes, hopefully I'l be able to wait long enough that the clone revolution will have died off some, the rest of the computer will have caught up with the main processor (which I think will have to start happening with the P5) and by then hopefully things will be more equalled out by the software between Apple and the clones (and hopefully Atari...hmm). But I digress.

For posterity, I hear that a clone-realm communications package that's worth a bowl-of-lard-with-a-hair-in-it had not come on the scene until about a year or so ago...(Suffice:Not long ago)

What does a 'ware like Tempus (et al) do differently from a good wordprocesor that makes it necessary?

> C, all the GNU stuff, 4-DOS, Borland's excellent source level debugger,
> etc. etc. There's a world out there! Why do you *want* to stay

> DECIDE to stay with Atari?

It's not a matter of >wanting< to stay uninformed, it's just that I'm really busy getting informed about a lot of other things, and just haven't gotten the juices flowing in that direction yet, I have no money to do anything about whatever I might find, and things in the clone realm are moving so fast that I'm sure whatever I might buy would be so obsolete by the time I outfitted it to my tastes that I'd regret investing in the computer more than bumping my shin on my bed-frame. (!!!) Anywho, when the time finally comes, that, as per usual, will be my plan of attack: know more than the salesperson could possibly know, investigate, read, then buy.

I call it a disease because of how fast it's spreading, and how little thought
is necessary for it to be contagious. (No further implecations intended! :-)
And common sense tells me; what I have works, and works well. Thumb your nose
at anyone who says theirs is best and then ask why! Eventually I will be the
judge again.

:-) Sorry, I guess I'm just a very semantic person. :-)

Not that there are many _other_ similarities, but: Not _wanting_ herion is a
good sign you've never had it. :)

As I've said (in different words) before, things like multi-tasking, I'm
certain, are nice, but my budget dictates necessity, and necessity it is not.
And neither are a lot of things many have been forced to take for granted.

>>Or the people are raving for some of the wrong reasons...

Take the percentage, any percentage, and figure the nature of the piracy beast, and I'd have to guess that with the extrodinarily high number (percentage) of clone-people pirating there'd be one hell of a network like no Atariian of the Atari hey-day had ever seen.

Hmm! Is it like the 3D movement system I've seen in Castle Wolfenstein 3D?

-Matt

P.S. I'd like to take this to E-mail since it's getting so long, but my mail to you bounced a bit ago. I'm gonna try some more mail tonight before I sack out, but if you could, please send something to me in E-mail so I can just try to reply and let the mailer use your "default" address.

>requirements? The sodtware/hardware priceratio has been decreasing steadily
>for the last years for DOS-machines (IBM-clones), but it's still a bit to high
>for me or for the general user IMHO.

Lets see... I can get a
386 40Mhz , SVGA Monitor & card, 1.44Mb 3.5' floppy, 80Meg HD,case, 200W
power supply, keyboard, 4Mb ram, for about US$1150
My ST was US$550, Monitor US$400, Hard Drive US$750 (105 meg)
that's US$1700
The ST setup would cost me around the same price today.

If I had the money now, i'd get a PC. I wouldn't sell my ST to get it though,
the reason... the ST is fun to use. Not saying that other systems aren't,
but they're not as good as the ST.

Craig.

No it's not!!! Have you tried anything else??? Gem is bloody awful!
Try using Gemini.

(btw: you'll need a HD for it, it will work off floppy, but it's not ideal)

I see...it would have been better for me, I guess, if you would've said, "You make the ST market suck for the developers." I would suppose that is true. I also simpathize that it is unfortunate for bot myself _and_ the developers, because I'd realy like for things to be more equal -- I _do_ like many of the shareware-type things I have and would be (and _will_ asap) _more_ than happy to compensate, but...well, we've been through that before.

Certainly you aren't deaf and blind to the typical office scene: d00d/kingpin buys new ware, leech also would like new ware, d00d has no objection since leech also happens to be friend/coworker? I don't think _anyone_ know axactly how many pirates there are out there, but I'd say for every copy of most programms typically showing up in an office, there would be upwards of five pirate copies made. Of course this would be heavily dependant on the size of the company, size of respective department, and other things, but I don't beleive this to be a fantastical overstatement in very many cases. -D00D- :)

What memories that lingo brings screaming (in digital) back! Remember all the "warez" that "ruled?" How about the Atari 8oo? Heheh.

667. MultiTOS - 68000 Yes, or no?

Newsgroup: comp.sys.atari.st
Date: 1993-01-13 06:19:44 UTC
From: mforget@elfhaven.ersys.edmonton.ab.ca
Message-ID: <H.eg.CO1hkU44oV_@elfhaven.ersys.edmonton.ab.ca>
Source record: 212244

Hi!

Over the past two months, I have been hearing poeple claiming that MultiTOS not be available for 68000 systems. Now, in the last week, I have heard that it would be available for 68000 systems. This is an important issue to me, and I suspect that it is especially important to developers.

If MultiTOS is not available for the existing user base, WHY would developers develop programs to take advantage of the features of MultiTOS. The Atari user base is small enough as it is, but if a developer is forced to write an application for an even smaller group (a mere fraction of the current user base) than they will have a hard time making money.

If MultiTOS is available to the public (even at a price or completely software based) than developers would be able to write their programs for a larger group of people and make more money.

The main argument that I have heard against releasing it for 68000 systems is that it would not be very fast on 68000 systems. I am of two opinions about this, though. Many 68000 systems operate at 16MHZ (through accellerator cards) and many others were built that way (the MegaSTe, for example).

I am looking for a definite answer, though. Will it be available for the 68000 systems?

Hey.. yeah, that's true.. it's just been so easy to pop boards and drives
in and out of my PCs that I sort of forgot that..

I guess if I ever feel nostalgic about the fun times I had upgrading my
ST, I can take a hacksaw to the case to make a replacement drive fit, or
clip out the CPU chip with cutters instead of pulling it out of its socket..

I think I'll draw the line at piggybacking chips though..

670. Which unzipper do I get?

Newsgroup: comp.sys.atari.st
Date: 1993-01-13 06:42:08 UTC
From: dave@admiral.uucp
Message-ID: <1993Jan13.064208.5724@admiral.uucp>
Source record: 212170

I recently got the file "rawfiles.zip" from atari.archive, so I can see what Photochrome can really do. Unfortunately, the unzip utility on my unix box won't decompress the file, and I don't have an unzipper for the ST...

So, no problem, I thought, I'll just request an unzipper from the archive. But, when I get the index from a.a, under the heading "Archivers", it says that the index of that directory was destroyed in the move...

So, what's the name of the file I need?

Also, please respond via e-mail. We currently aren't getting any messages coming in from c.s.a.st.

Thanks in advance!

> Well it goes both ways. To change cards on the PC you muST remove the
> case, there goes the warranty and insert the card.

Umm.. actually, no.. none of the PCs I've worked with have had any
seals over their screws the way Atari's products do.

In fact, since the computers are expandable, the manufacturers EXPECT
you to open the cases. My PS/2 has a switch inside that lets you defeat
the built-in password protection (in case you forget your password), so
they provide a keylock that keeps you from opening the case.. in other
words, they expect you to open the case.

The owners' manual even gives you pictures showing how to take off the
case and insert new cards.

>Just like the ST, except very few ST's applications are inside the case.

Well, really NONE of the ST's applications are inside the case, since the
computer isn't designed to be expandable. In Atari's view, there's no
reason to take the case off, since there's nothing you can do to
expand it.

No. I am not kidding. As far as my BBSing experience goes(/went? all 6 or 8 years of it) BBS's are nearly exculsively pirate forums. I speak especially for time around 1986-7. This would've gone for every platform know to popular mankind too, not just Atari and IBM -- Apple, Tandy Model 3 (before clone infection), Commodore -- everything. In my area, there were about 20 +/- 5 BBS's. I'd say 3 were exclusively non-pirate. One of them had a sysop who pirated strictly off-bbs -- I knew him.

Anywho, this is not the forum of pirating I was talking about -- I meant white-collar pirating. You-ve probably read my message to Dave Baggett where I talked about that, so I won't go into it again.

> Perhaps, the real reason we "sing our song" is because we get better

>How is it defeatist? Writing good software takes an enormous amount
>of time, and in the Atari market it's done with no thanks at all.
>The attitude of "why bother" is the Atari spirit now, it seems.
>"Why bother trying to get new users on board?"

New users of what? I certainly wouldn't reccomend anyone to get an
ST, it's old & expensive by todays standards... and as for the
Falcon, i'd be suprised if I _ever_ see one in this country.
I honestly couldn't seriously reccoment to any _new_ user to get
an Atari.

The current user base is a different story though, we've already got
the machines, they're not too bad for their age, they could have
done with a faster serial port & multitasking that the amiga from
the same period has, but they're nice to use. There's still lots of new
software coming out from the PD/Shareware writers.

>"Why bother trying
>to keep developers happy?" "Why bother sending in my shareware
>payment? Let Dave Baggett rot in hell!"

Yeah I agree.

Just kidding!!! ;-) ... I don't use any Dave Baggett software, but even
if I did, I wouldn't be sending any money for it. The reason... I haven't
got any money to send! If you write for fun, i'd encourage you to stick
with us Dave, you'll never see any money from us, but you'll have our
support and appreciation. If you want to raise some money, try writing
for the PC. I don't know if you'll do much better, but there is a much
larger user base.

Now a serious question... Is there any user here that has the cash to
go out and buy a new system that is sticking with the atari???
If so why?

The reson for me asking is that I suspect that most other users here
are in the same boat as me.... they can't afford to move on.

Craig.

>For posterity, I hear that a clone-realm communications package that's worth a
>bowl-of-lard-with-a-hair-in-it had not come on the scene until about a year
>or so ago...(Suffice:Not long ago)

This is more misinformation. Qmodem has been around since before the
first ST rolled off the assembly line. It's damn good, but not as good
as Telemate, which does its own multitasking (as does Epsilon, my other
favorite damn impressive PC application).

Telemate is better than Uniterm by quite a wide margin in terms of
useability. The only thing it's missing relative to Uniterm is
Tektronix emulation. (I don't need it, so I don't really care.)

>It's not a matter of >wanting< to stay uninformed, it's just that I'm really
>busy getting informed about a lot of other things, and just haven't gotten the
>juices flowing in that direction yet ...

If you *know* you don't know what's out there, why make statements
about the clone world that (as far as you know) may or may not be
correct? Half the reason I get so into these threads is that I used to
think the "DOS world" sucked too; then I actually got a PC and used it
for a year, and discovered an incredible world of software and hardware
out there (of all kinds) that I never knew existed. Having been on
both sides of the fence, so to speak, I really feel that I know what
Atari (and hence Atari computers) are missing.

>I call it a disease because of how fast it's spreading, and how little thought
>is necessary for it to be contagious. (No further implecations intended! :-)

There's no shame in doing what everyone else is doing provided it's the
smartest thing to do. This sounds like more of an anti-mainstream
attitude than a pro-Atari one, and I've seen it before in comments
about PC's being "boring and everyday." This is not common sense or
logic talking -- it's the "will to be different." Not computers
at all, just philosophy ... religion.

>And common sense tells me; what I have works, and works well. Thumb your nose
>at anyone who says theirs is best and then ask why! Eventually I will be the
>judge again.

Yes, the ST works pretty well. It's slow by today's standards, and you
can probably get more work done on other newer machines, but it's
certainly not useless. Anything you have now you'll be able to run a
year from now. Likewise, PC's are perfectly good machines, and they're
amazingly inexpensive now. That makes them the best bang for the buck
(and for most people, the all around best buy) in the computer industry

now. That's all I'm saying here: PC's suck no more than your ST does.

>Not that there are many _other_ similarities, but: Not _wanting_ herion is a
>good sign you've never had it. :)

Wow, that's a tough one to bend my mind around. But where your analogy
fails is this: PC's won't hurt you; they're not evil. Being able to
buy any one of a thousand new software products at your local Babbages
will probably, like heroin, make you very happy, though. (At least
in the short term.)

>Take the percentage, any percentage, and figure the nature of the piracy beast,
>and I'd have to guess that with the extrodinarily high number (percentage) of
>clone-people pirating there'd be one hell of a network like no Atariian of the
>Atari hey-day had ever seen.

You'd guess. Will you agree that your guess means as much as mine?
And my guess is that there's an *equal* amount of piracy on all
platforms these days. How do we resolve this impasse without some
factual data?

>Hmm! Is it like the 3D movement system I've seen in Castle Wolfenstein 3D?

Yeah, but quite a bit better; Underworld models lighting and does
non-rectangular surfaces. Essentially, it's a texture-mapped flight
simulator in a dungeon, and you ride around on a motorcycle. :)

>P.S. I'd like to take this to E-mail since it's getting so long, but my mail
>to you bounced a bit ago.

My machine "case" is now hosed somehow. Mail to dmb@ai.mit.edu instead
of to dmb@case.ai.mit.edu.

When you speak in short consise sentences, your grammer needs to be clearer.
This is why people may have misunderstood, or misconstrued your actual intent.
You needed a comma between "convincing" and "the." And a little keyboard
emphasis on the nice could've helped.

> out WHO YOU directed this part too.

It was aimed at the readers of the group; especially those who
exemplify the sentiment given above; the attitude of "I don't
care about the confederate OTHER users, or the disillusioned
developers, or ..."

> Oh I see now, it is not aimed at ME but at the sttitude you have
> encountered. Why mix the two Dave. I still say I have no requirement
> for your software and as such it does NOT effect ME in one little
> bit. However you have encountered another thing here which I do
> agree with the "me syndrome". But do not mix postings Dave, ok!

This is not in any way limited to MY software. When I say
"developers," I am including people other than me, and when I say
"Atari owners/people with XYZ kind of attitude/etc." that's not
limited to you personally.

Is it wrong for me to refer to personal experience? Does that make me
an egomaniac or something? I suppose I should blush and tell you I
never really wrote anything.

>> Talk about defeatist attitudes -- it's clear from your
>> tone that you DON'T care what happens to Atari developers and Atari
>> users provided YOU'RE happy. It once again blows the theory that the
>> Atari community is wonderfully supportive.
>
> Wrong David! Very wrong indeed. I do care what happens to Atari
> and its related developers but remember you are not the only person
> in the world who has writtens software and felt the way you do.

True, I'm one of THOUSANDS of people who have put time, energy, and
money into developing software for the ST, only to be dumped upon
by not only users, but Atari Corp. as well. You (pl.) don't care
that Darek has invested X thousand dollars in the Atari world and

not made the money back, because he's not "one of you" anymore. HE says things aren't all that rosy. Damn that Darek!

> Infact I think many developers on many platforms would say the
> same thing you have. I think that saying I do not care about
> what happens is total CRAP on your behalf and not even implied
> in any of my posts in this news group or anywhere else for that
> matter. Infact the complete reverse is the case.

Whatever you say.

> Just because you have become yourself disillusioned with the Atari
> platform do not take it out on those of us who will still be here
> in 10 years time and you will have been long gone David.

10 years -- that's a *good* one. Anyway, just because you *aren't* disillusioned with Atari, don't treat those of us who are like crap simply because we say things you disagree with.

What the hell did Chris say that set you and Natbang off so much? You treated Chris like crap, and you know it. You basically told him to piss off. I may have said a lot of things, but I've never written someone off like that.

It works both ways -- I've never been overtly nasty to anyone for disagreeing with me here (except maybe Paul or Warwick, and they knew they were goading me into it -- <grin>) and when you suggest that we're playing equivalent games here you're not being fair at all.

David can rant all he wants about how nasty my posts are, but I've never said anything that wasn't either defensible factually or clearly my opinion. I've never written ad hominem stuff (like "you're stupid if you think XYZ" or "you realy need to get laid if you think PQR"). What is your gripe here? Find a post where I was nasty and show me what you didn't like. Saying something you simply disagree with is NOT nasty, but it does show how incredibly sensitive you are to people disagreeing with you.

>> Because Atari's line of computers sucks by current standards, so
>> people rightly feel that putting more money into them might not
>> be such a great idea.
>
> David, never pretend to speak for everyone else, as NO ONE has
> given you a mandate to do so. Maybe David Baggett is upset but
> I am not. I am happy with all the Atari machines and devices here
> at this domain STaTus.gen.nz and all the other bits and pieces.

I was giving my opinion, and it also happens to be a factually defensible one. Let's go out and survey 1000 randomly selected people in the world who call themselves "computer enthusiasts." We'll ask them whether they'd buy an Atari as a first choice for their next computer. Percentagewise, I'm quite sure you'll find that me *opinion* about the attitude of the general public ("people" above) is accurate. But I'm

all for testing it.

And if I am upset with the way the Atari community has gone, it's only because I care about the Atari world and (yes, of course) about myself too. Unlike the cheerleaders, I'm not willing to stick my head in the sand and let it go at that. I've lost a lot of time, money, and, frankly, faith in humanity in general because I was stupid enough to develop for the ST. I see no reason why I should pretend that everything's all right, or NOT counter ridiculous claims the cheerleaders and misinformed make about other machines just because you can't handle hearing criticism of your machine.

> I see you must have read my final note, as you did not reply.

What? Me, not reply? Never! :)

No ...Replay, Replay II and the many other ones, Kinda
like Soundblaster on the PC.

> > - Happy (the orginal) <- A pirate tool is an "expansion"..?

Wrong Bob, did do much wit it did you if all
you used it for was pirating.

> > - All the accelerator cards <- Hack and Slash, Hack and Slash
> > - Video cards <-Hack and Slash again
> > - Hard disks <-Sort of basic, eh..?

Taking things for granted arn't you Bob?

> > - CD cards <-Say what?
> > - Rom cards/drives <-ROM? Flashcard drives? Say what?
> > - and the list goes on and on and on and on <-not very far it don't..

RomDrives, Rom Cards. The readers from .de on
this group will be familiar with the "CT" rom
drives, Gee Bob I still have a few here. It is
a ROM (27256 or the likes ie 512) card with
programs on it that boots before the hard disk.
But hey you know this already! The CD cards and
Omti cards are from "CT" as kitsets as well and
work very well. It is in effect an IBM 50way slot.
That is right just plug the IBM cards in Bob!
>
> > Hmm this resembles the same sort of upgrades you get for the PC to me
>
> Again, give me a break..!

Bob give ME and the reST of us a break. Just because you have not seen
product do not throw it back in our face. Remember you are in the USA
a place that has access to MORE Atari product/3rd Party product than
those of us in New Zealand, but here we are with us at the end of the
world knowing and using stuff you have not even seen. This to me is a
little confusing to say the leaste. In fact it reminds me of the old

"silver platter" saying.

> in this post of your David. This site... [lots of PC's]

OK, let me revise my assessment of your post, then. Instead of
being simply ignorant, you're intentionally making stuff up
which is false to win the argument. Void the warranty by opening
the case? In what universe?

> I would not want Atari to do nor any PC firm Dave as I do it myself
> and save the BIG bucks for a service contract.

Save yourself that FREE on-site service. Big price differential.

>Well you said it, I am sorry, your are one of the "Techno Bunnies"
>Dave, but hey that's life for you mate.

Well you're really making yourself look very bad here, Jon. I'll just
let your ranting go largely unanswered. Now that we're into the
personal attacks it's clear that the discussion has become
unproductive. Sigh. And all because Chris Mauritz asked about Atari
computers. And you told him to get lost. And I told you about my free
TRW on-site service. Yeah, I guess I can see why that would make you
write something like this. Sort of.

>Having just said this and read your above quote. Dave you seem to be
>telling mistruths in your postings. Calm down and take deep breath next
>time mate. See your reply to my first message at the top of this post.
>We did, we know you are telling fibs as we just read the quote a few
>lines above. So what do YOU KNOW ABOUT IT DAVID? NOTHING you have just
>told us all. (Oh why do I bother to continue? it's fun!)

Everything I said about Gateway is absolutely correct. You may call
them and ask them yourself. I URGE you to check the veracity of my
claims. I was posting based on personal experience. Why do you think
I'm lying? Again, you're just making wild claims here.

You first claimed that PC's aren't really upgradeable because you have
to take the screws off, which is often difficult in your opinion, and

that you void the warranty in doing so. Neither of these things is even remotely correct for any clone I've ever dealt with. And in fact that clone company I've dealt with most provides free on-site service through TRW. Is that so offensive?

>> Another word about user support: The Maxtor hard drive in my PC

>
> Hey Dave, re-read back issues of some of the on-line magazines
> and I even tell you how to do it (grin). A SCSI, boy what a bunny
> David!

What *are* you on about here? I have SCSI drives on my ST and have had for a long time; that's the main reason I got a SCSI card for my PC -- so I could use my Syquest drive with both. How does having my hard drive die make me a bunny? Am I supposed to open up the hard drive and fix it myself with a chisel to avoid bunneydom?

> (about 3 years ago david, I'm reading your mind)

Not very well, evidently!

684. Amobea HAM 4096 into STE 4096?

Newsgroup: comp.sys.atari.st
Date: 1993-01-13 10:30:08 UTC
From: mcsdc1ph@dct.ac.uk
Message-ID: <1993Jan13.103008.2741@dct.ac.uk>
Source record: 212172

Hallo.

Is there a program floating around that can convert Amobea HAM 4096 pics into STE 4096 colour pics?

Whilst on that point, does anyone know if STE has a true 4096 colour mode akin to Amobea HAM? Or does it have to be a SPECTRUM style picture using HBLs?

At the moment I have successfuly managed to push Amobea IFF pictures in 4096 colours onto STe, load them into SPECTRUM 512, and have them converted into 512 colours. This is quite good, but spectrum occasionaly conjures ghost pixels which mess up the screen, and anyway, I want to see those pictures in their full glory on STe.

Help would be greatly apreciated!

Thanks.

Feekzoid

>I think the commercial piracy situation has gotten better since software
>manufacturers have started raiding corporations.

A company I used to work for was prosecuted for using pirated software. Here it was POLICY to buy one copy of Lotus-123, MS-Word, Harvard Graphics etc etc and then distribute them round the Company (around 1500 employees, and 400 PC's). A guy who was made redundant decided to get some revenge, and reported this theft to FAST (Federation Against Software Theft). They came and deleted all the pirated software, and left a Court Summons - it was, I think, settled out of court, with a HUGE fine (rumours of 250,000 pounds.

It has now been made a dismissable offence to use pirated software on any computer on Company premises...

686. ICD FAST drive woes

Newsgroup: comp.sys.atari.st
Date: 1993-01-13 11:14:00 UTC
From: SML108@psuvm.psu.edu
Message-ID: <93013.061400SML108@psuvm.psu.edu>
Source record: 212174

Hi, I have a 3 year old 50 MEG ICD FAST drive... Today, it was hooked into some slightly screed up ICD software and something happened to the drive... I have reformatted the whole drive now and some of the strange things that were happening disappeared but now it no longer autoboots and HDUTIL cannot always see all of the partitions even though they are installed and can be opened from the desktop. Anyone have any idea what's happening?

>and possibly the Amiga 1200.

Well, the Amiga 4000 is out of my price range. And even though the 1200 is not, how will the DSP be connected to the CPU? I have a feeling that the Falcon DSP will be the fastest of the two because it is sitting on the DMA bus. If Commodore manages to give it equally fast access, I'll definitely give it a look though!

>maximum performance out of a machine) to worry about their program being
>a little incompatible with future generations of chips? Particularly if they
>are not even aware of the these new machines etc when the software is written.
>Maybe you would prefer it if the games were a little slower or a little less
>impressive, but I certainly wouldn't.

On the ST I have written routines to perform smooth horizontal scrolling,
colour screen interrupts, sprite drawing, joystick/mouse/keyboard reading etc
tp the same speed and quality as those used in commercial games and ALL of the
programs using these routines work fine on every Atari machine including the
Falcon. I see no reason why others can't do the same?

A shitty programmer is one who ignores Atari developer information and thinks
they know better. In fact most of them don't register as developers.
They see the machine purely as a bunch of hardware and their program.
How would these people feel if their favourite development tools didn't work
on the new machines because of bad programming?
BTW> An Amiga owner once told me that his assembler (or was it his C compiler)
didn't work on his new machine due to incompatibilities and he had to get the
new version! What the hell was it doing?

Now while I understand the need to access the hardware directly for some
things like sprite drawing and sample playing, no-one is going to convince
me that direct FDC/DMA access is a better way of loading your data than using
system calls. It ties the program to floppy and if software timing loops are
used then it fails on a faster machine. If programmers had avoided such brain
damage then maybe today we'd have really big games that install on HD.

I have Speedball 2 for the ST but because the Bitmap Brothers used direct
DMA/FDC access and non-68030 compatible code it won't work on my Falcon.
The PC version is file based, installs on hard disk, work on 286-486 and

can even use keyboard control.

There are very few reasons why a game has to take over the whole machine.
Why can't we have programs that run from hard disk, go into whatever
resolution they want, play, and then quit back to the original desktop.

If programmers of simulators like Falcon or Formula One Grand Prix had obeyed
some simple rules think how much their programs would benefit from the extra
speed of the Falcon030.

No, I'm afraid there is just no excuse for bad programming.

: [...]
: Now a serious question... Is there any user here that has the cash to
: go out and buy a new system that is sticking with the atari???
: If so why?
:
: The reson for me asking is that I suspect that most other users here
: are in the same boat as me.... they can't afford to move on.
:
Well... perhaps not everyone has the "want to have the fastest, cheapest
computer with the best graphics, and lots of free (pirated) software"
attitude. I have a Mega STe 4, and it suffices for what I need to
do - I use MiNT/GCC to run GNU-software, use TeX a lot, and do some
programming (for fun) in C and assembly. Sure, it would be nice
to have a 486, but I really don't _need_ one, just because everybody
else has one and it's better value for money and I can pirate everything
I need (as 99.9% of all PC users do, as far as I know). And, I've been
using STs for 6 years now, and I prefer to stick with them instead
of having to start all over with a new system (and learn about its
innards). I can understand people like Dave B. though who have to
leave the ST world to be able to make a living! I don't have to, so
I don't see why I should throw away my ST though as long as it does
what I want it to!

|be quite a steal. ??? Anyone?
|
|
| -Matt

Be very aware that you can use the SLM804 (and SLM605 too) only
on STs and TTs (not even on Falcons without some kind of adaptor
it seems).

If you doubt about moving to some other platform within short time
I'd think that $500 is still a big amount of money.
If you do not it may still be too much; think about what a (used?)
laserjet or inkjet costs these days... I payed about f600,- (about $300)
for an SLM804 after having it repaired, but maybe I had just plain luck.

One more word about the emulators: if you buy that SLM804 it should
be accompanied by the diablo emulator, a gdos driver, some fonts
and some other stuff. SLM804s were sold with that in the box.
The fx80 emulator is called laserbrain and is a DMC product.
I saw it on some archive lately however, so it may be public domain
by now.

I hope this helps you make the decision.

Anybody out there know of AIM - the digital image manipulation program? I'd like to know what the last released version was. I have 2.51 and it seems to crash pretty often on an STE. Is this also true for STFM's ?

I'd also be interested to hear of any applications people put AIM to.

Cheers

Sam.

neil@cs.hw.ac.uk (Neil Forsyth) writes:
: [...]
: There are very few reasons why a game has to take over the whole machine.
: Why can't we have programs that run from hard disk, go into whatever
: resolution they want, play, and then quit back to the original desktop.

I think the main reason why this is done, is that programs that only
load from disk can be copy-protected better, and that most companies
seem to think that very few ST users have harddisks... While this
may or may not be true, usually those people who can afford a harddisk
will buy more games too (IMHO). On the other hand, there is no copy-
protection that can't be removed, so it doesn't make much sense
anyway. Game companies had better make sure their games will run on
future machines, since it's not very probable that ST users will stick
with 8 MHz STs forever...
A second reason may be that game companies aren't willing to invest
enough time and money anymore into the ST market, and so their products
end up quick & dirty - on the other hand, they would probably make
more money if their games ran on the TT/Falcon, who knows!

Hey Dave, will you ever release Game Workbench? (for the ST!)

: If programmers of simulators like Falcon or Formula One Grand Prix had obeyed
: some simple rules think how much their programs would benefit from the extra
: speed of the Falcon030.
:
: No, I'm afraid there is just no excuse for bad programming.

No excuse, but some people are just too short-sighted...

Yeah, I can agree with that. I'm not a developer, but I got DocSupport II (supposedly the best presented of the DS set) and I can hardly say I was impressed.

Atari need to bring out some BOOKS with the Falcon, giving memory maps, official registers and most importantly, MiNT documentation. Preferably in proper paperback. I don't mind paying 20 odd quid (UK Pounds) for books, but I'd like what I get to be more than the output of a photocopier!

David.

} LineA? I doubt it, since compatibility would drop to about 10% !!
}
} Or is it just the UNDOCUMENTED negative LineA offset values?

As far as I know, Warwick, all the line-A stuff is now officially frowned upon. On the TT they have retained it for compatibility, but it will disappear soon. I have no idea whether the Falcon has it or not. The reason given is that line-A is not sufficiently flexible for the new generation of machines coming out. It was originally supposed to be a fast graphics interface, and hence wasn't particularly general.

> something like that - not RS-232].

Sorry, not true about needing a special modem. Yes, you do need a cable to go from the Mac's mini-DIN connector to the standard RS-232 connector, but 'normal' RS-232 modems work just fine. The Mac's serial ports are RS-422, which uses a differential signal pair as opposed to the single-ended approach of RS-232. All that's necessary for RS-232 compatibility is to ground one end of the signal pair - this is done in the cable.

I do. I have read a bit about the various registers in AGA.

> Isn't it smarter for the information to come from Commodore?

No.

>Whether Commodore or Abacus publishes the definitive hardware reference
>manual, it's completely up to Commodore.

No, the point is that C= can happily redefine the AGA bits as they please
without anyone having any reason to complain if they fall flat on their
face on the next generation.

>Paul Steffen

All this really goes for Atari too. It will make it easier to come out with
more powerful hardware if you don't give away all the specs. If the specs
lock you into an impossible situation, you have to keep all of the old
hardware and make some totally new along the side. It is much more pleasing
if things works better on new chips using the same approach as before.

I am so thankful that trn provides a browser from which I can
select/kill articles at the subject level. This makes it VERY easy to
avoid a lot of the noise rumbling around Comp.sys.atari.st right now.

A hearty "thank you" to the authors of trn.

By the way, is the set of threads currently running under the general
topic of "advocacy" REAL, or are some people orchestrating it as an
argument for the creation of an "advocacy" newsgroup? Just
wondering...

704. Falcon Party report

Newsgroup: comp.sys.atari.st
Date: 1993-01-13 15:04:53 UTC
From: sanders@sci.kun.nl
Message-ID: <C0ssK6.3IK@sci.kun.nl>
Source record: 212121

Some time ago I went to one of the so-called "Falcon Parties". There were three Falcon030s set up, one running Falcon-Genlock by OverScan, having a video camera connected to it via the genlock, and running Overlay by OverScan to produce on-screen scrolltexts and graphics. The other two Falcons were hooked up to Eizo 21" monitors (auch, these really are aquariums!), one of them was operated by a guy from Compo Software, running their new Musicom program, with which you use the DSP on sound to give various effects such as Karaoke, Digital delay, Flanger, Harmonizer, Equalizer, Jingles and HD recording. It was more of a nice toy than a serious program, IMHO, and costs only about 70$. The third Falcon was operated by a guy from Atari Benelux (well, at least I _think_ he was from Atari, since he spoke of "us" and "we" regarding to Atari) and he showed the bundled software. About these programs: don't expect too much. Calappt was nice, I haven't seen Procalc but DA-calculators are as old as the ST. System-Audio-Manager wasn't showed, due to copyright reasons (so I was told) but it enables you to link sampled sounds to system actions, like we know from the Mac for years. Well, it IS funny to actually hear garbage can noise when you drag a file to it, and a creaking door when you open a window. But there are PD programs to do these things on an ST, so there's nothing really new here. The talking clock... well, that's another funny but not-very-useful program. I rather have a modest little clock in the corner of the screen.

Landmines is a "Mines" clone, as bundled with MS Windows, and the "full use of the graphic and sound facilities of the Falcon" is not too special either. The explosions just sound a bit more... well... explosive than you might expect. And Breakout is not too special either. The "Game over, man" when you die is an old sample which can be found on a.a. They should have done a re-sample at 16 bits, with less noise.

Audio Fun Machine uses the DSP to add effects to sound, such as echo, reverb, chorus, equalization and pitch bend. The graphic equalizer is nice to show off the speed of the machine. AFM can run in the background while you return to the desktop, even without MultiTOS.

MultiTOS looked quite nice. It's NOT bundled, as we already know, and will NOT be released in ROM in the near future. (And probably not in the far future either... :) The overhead wasn't too bad.

In short, the software that was shown was not all that impressive. Apart from MultiTOS of course. I couldn't get a good impression of the "real life" speed of the machine. For that, I would have liked to sit in a TOSWINdow and have Metafont make some fonts, or TeX a big

document. The harddisk is astonishing though, by far the fastest I've ever seen (apart from those on our Unix boxes of course). It is said to have 12ms access time, which I don't find hard to believe, and maximum 3M/s transfer speed. Quite impressive, Virtual Memory should by very nice on this thing.

See my next post for a list of products for the Falcon.

>
>Regards,
>Eric

Could someone enlighten me? I was under the impression that line A calls
were a no-no because the newer motorola processors use the same opcodes
that lineA does, which kills any line A calls on a newer machine...

Could someone please clear this up? I'd like to know what the story is,
and how this relates to graphics cards and the VDI. If my above
assumption is incorrect, what is the complete story on Line A?

I'd like to know, as the program I'm writing uses a single line A call
to aid in a graphics resolution change (the program is C, I got the res
change code from another programmer, and I don't program in assembly, so
I don't _completely_ understand the code.)

Thanks for any help.

If I read right, I believe Bob Broadie said that the whole MultiTOS
would fit on a single 1.44meg disk, so no need for CD ROM yet (though
it would be nice anyways)...

At the Falcon Party I visited, I talked to one of the operators
of the Falcons there, an employee of Atari, and we discussed about
MultiTOS. He told the public about Eric Smith, and said (about) "And
one of those famous German programmers is now working for us too, in
the development of MultiTOS. But I can't remember his name at the
moment."
"Julian Reschke?" I guessed.
"Yeah, I think that was him," he replied.

If this is true, than Atari made it's second good move in recent
history, after the employing of Eric Smith. Can anybody confirm this?
(Mr. Reschke?)

Boy, am I looking forward to the Falcon Profibuch!

Yes, Line-A is considered un-Kosher programming...The official word from
Atari is: use VDI calls (painfully slow).

Well, looking at Zeos' price listings, a '486sx/25 LocalBus system is
~$1500, depending on how much RAM/disk you get. That's with the
monitor, unlike the ~$1700 for the Falcon030 4M/65M setup. Oh, and it's
a LocalBus video card able to do 1024x768x[16? 256? probably 256, since
it's a 1M card].

> Invest in at least 500 megabytes for a hard drive, and tape backup system.

I think not! ~100-200M is enough, and since I'd pay the extra $49 for
SCSI, I'd be able to add any of the drives I'm currently using on my ST
to the system. A much better investment would be 8M of RAM, so OS/2
(or, if I hate that, unix) would run more smoother (less paging).

A tape backup would be nice, but backing up 100-200M onto ~1.52M
floppies (courtesy of FastBack+, which compresses ~2.2M onto each disk)
isn't that gross. Hell, I do it now with my ST once a month...

> If you get interested in one of the desktop UNIX environments, you'll find that

> backup.

But, ya see, I don't want a unix system... In the fall (when I first
ran into the '386bsd/X archives) I looked long and hard at what I use a
computer for. Something like OS/2 suits my needs much better.

Those DAT drives are _steep_...

> A CDROM drive is also becoming 'standard equipment'. Be sure the one
> you get can handle the KODAK CDROM disks.

Almost any CD-ROM on the market today can handle single-sesson PhotoCDs.
I've only seen a few (VERY few) that could handle multi-sesson disks.
And I haven't thought of a use for PhotoCD for _me_ yet...

> The

No kidding... I've seen enough of the junky VGA monitor/card
combinations at work (lucky, not on my machine).

> applications.

Don't you think _every_ new user of an Atari feels cheated? After all,
if it breaks, how easy is it for them to get it fixed within a couple of
days? I don't know about you, but I can't afford to go two weeks
without a computer on my desk... too much work to do. Where can they
go to get software? If they're a typical J.Q.Luser, they won't be too
thrilled with having to buy everything mailorder, and most people don't
have the luxury of an Atari dealer in the city, let alone close-by.

Did Atari show at the winter CES in Las Vegas this week? Nope.
Wouldn't want to show off their new machine a bit more, would they?
IMHO, contrary to what the Tramiel's have said, it's business as usual.
The Falcon's been orphaned even before it managed to flap its way into
North America.

I will stay with Atari even though I could afford to move to Mac or PC.
It's fun, and I'm used to it. Even though I develop on other computers
for a living, I like developing for the ST most. 68K assembler is by far
the easiest to learn and I look forward to learning 68030 and 56001 assembler.
The software I use on my ST is better than equivalents on the PC or Mac:

Devpac 3 is great as is GFA 3.5 and STOS. Games are infinitely
superior such as Bitmap Bros games, Sensible Software games and of course,
anything written by Jeff Minter.

Just my $.02

Darren King, GBC --> gbcusg@gpu.utcs.utoronto.ca

:Subject: TMS320c25 Amiga Board DETAILS
:
:Hi all again,
:
:here we received several e-mail with questions on the TMS320c25 DSP board
:that we produce.
:..So keep the informations coming!
:
:
: - General purpose dsp board, (not only for audio applications)
: - 16 Kbytes of fast Sram zero wait states for the dsp (25ns) dual port
: - Autoconfiguring for Amiga: 500, 1000, 2000 and 500+
: - General purpose Serial interface
: - All 16kb are memory mapped in the Amiga memory
:
:
:
:
:Software pakage:
:
:There are two software pakages:
:
: - Minimal software for DSP using including:
: - DSP.library
: - Various DEMO program including HI-Speed Mandelbrot
:
: - Professional Development Pakage including:
: - Macro Assembler
: - DSP.Library
: - Extended DEMO pakage.
: - 320c25 Assembler Manuals.
: - Demo source code
: - Block diagram board project
:
:The price are:
:
: $299.00 for Basic System (minimal pakage)
: $399.00 for Professional pakage.
:
```

:
:We are producing the board, but we have TOO orders, so we accept only
:RESERVATIONS. NO MONEY ORDERS, we accept money only on shipment.
:Please reserve Your DSP board with the indication of YOUR Amiga System,
:at the Fax # + 39 41 957 192 or e-mailing to me.
:
:
:
: Renzo

Well, anyone got some constructive observations of this DSP-board?
Anyone got the specs for this DSP?

715. Any SCHEME for the ST?

Newsgroup: comp.sys.atari.st
Date: 1993-01-13 16:36:33 UTC
From: a2doecke@rzdspc17.informatik.uni-hamburg.de
Message-ID: <a2doecke.726942993@rzdspc17>
Source record: 212105

Hello out there!

I was wondering, if anyone might be able to tell me,
whether any sort of SCHEME-dialect exists for the ST.
And: If so, where can I get it (including a manual)?

Else maybe someone can tell me, how I could get a brief
or verbose (even better) manual for Cambridge Lisp.
It's not that I'm too hot on doing anything in SCHEME
or LISP, only my teacher insists on it.

Thanx,

Patrick

I think you'll find he meant standard as in unremarkable. and yes, I suppose
at one level a hard disk is only a convenience for the home user, but once
you've used one you won't be able to live without it. It depends on the sort
of work you do. DTP software, compilers, etc will all work from floppy (who's
going to restrict their market by doing a product that wouldn't), but you
will be far less productive than a user running the same software on a machine
with a hard disk. OTOH, you wouldn't buy a hard disk for your game boy...

> the ST, (ever heard of UNIX!? And the hundreds of other PD/shareware ones)
The point is that there isn't a standard CLI built in that you can rely on
being there. On a Dos machine, you can rely on the fact that your program
is running over some sort of underlying CLI, and that any system() calls
you make will be handled sensibly - this can make life a lot easier at
times, though more so on a unix machine than a PC.

> So GEM is not a Real OS is it!? Damn, what have I been using for the
> last 5 years then!?

Actuall, GEM isn't even an OS, never mind a `Real OS' - its a graphical
user interface. 8-)

720. ADVOCACY: Does name calling and distortion do anyone any good?

Newsgroup: comp.sys.atari.st
Date: 1993-01-13 16:59:41 UTC
From: chu@acsu.buffalo.edu
Message-ID: <C0sxvI.BBn@acsu.buffalo.edu>
Source record: 212200

Before I start, I thought I would just state a few things that might get me flamed by all sides.

1. For the time when they were first released, the ST was quite a decent machine and powerful enough to be fairly competitive in its price point.

2. Atari never capitalized on its initial advantage and so it has ended up in its current situation. That is, Atari is in no position to take on the mainstream and Falcon may be its last shot at any sort of stability.

3. From what I've read, Falcon is not the "killer machine" that will launch Atari into the mainstream. Yes, it does offer DSP at a lower price point than previously available. However, I'm not sure that your average computer owner cares about DSP. An advantage that seldom gets exercised is not much of an advantage in this case. In terms of selling to the mainstream, a snazzy graphics chip would have been better than a snazzy DSP chip.

4. Just to survive, Atari can do what other small companies have done to survive (Yes, I consider Atari to have wasted enough of its assets to be a small company, they certainly seem to act like one). Find a niche and try to own it. To survive, they don't need the mainstream. Atari would be stupid to make on the mainstream with Falcon. However, Falcon is priced good enough and sufficient features perhaps for Atari to re-target the electronic music industry and for them to regain what they might have lost there. A favorable write-up in Keyboard magazine suggests that the Falcon as a niche machine might be successful, although it will still face sharp competition, especially since they still face a respect and credibility problem, no matter where they sell.

5. I wouldn't recommend an Atari to anyone these days. If they have one and need help making the best use of it, of course I would help, but unless you already have money invested in Atari, buying one now is a mistake.

The current "Power without the Price" system is probably some 486/50 box from (hopefully, a reputable) mail-order dealer (like Gateway) running Linux and color X.

Having hopefully offended the Atari Cheerleaders by suggesting that Atari is *not* "Power without the Price" and the Atari Naysayers by suggesting that there is a possibility for Atari to survive, I have to ask what the point of all this is?

What is the point of calling Dave Baggett an a**hole? Here is a man who has put more man-hours of work into supporting the ST than I care to count. (The only reason I haven't supported his shareware is because I don't use it, nor do I have copies of his shareware or freeware.) Does calling him a derogatory name weaken his arguments?

Yes, you can get a beta version of OS/2 on CD-ROM for $15, but will the official release be just as cheap and is it fair to compare the final release price of MultiTOS to the beta price of OS/2? The reason why OS/2 is so cheap is likely because Microsoft wants to encourage sales of the final product. (A very smart strategy that Atari should think about.)

Having worked on both PC clones and Ataris, I have yet to see a PC clone that is as difficult to upgrade as an ST. This doesn't mean that upgrading PC clones is the cakewalk that BobR seems to try to imply it is. Nor does it mean that upgrading STs are impossible. Actually, most of my problems on PCs usually involve shuffling everything around so that I have as much room under the 640K barrier as possible and 386Max does a good job of that (after a little tweaking). I wasn't really happy with using DOS, but no one says that PC clones must run DOS, although I have no idea if the availability for software for PC clones running Un*x is as good as the availability for PC clones running DOS (one of the things I still have to check up on as I'm looking for a new computer.).

What's the point of overstating and distorting positions?

There are going to be people who have valid and logical arguments as to why a Falcon is good for their situation, just as there are going to be people who have valid and logical arguments as to why a Falcon is useless to them. As I've said, IMHO, the Falcon is a niche machine, which means there will be machines which serve the needs of most people better.

The Falcon is a capable machine for the price. However, unless your needs specifically involve DSP, there are more powerful alternatives for the same price. (Adding DSP to a PC, unless you already have the PC, tends to knock the amount of money you spend into the next price point.)

Atari, which has made many mistakes in the past, is allowed to get one right every once in a while. If the Falcon allows them to re-gain a share of the music industry, this may be the one they get right. However, it would be stupid for them to try to go mainstream.

I guess what I don't understand is what are you guys arguing about?
It seems like one side is saying:
"The Falcon is not powerful enough for the price for general purpose computing."

and the other side is saying:

"But the DSP makes it price competitive in that a similarly equipped PC clone is more expensive."

and I think they're both true. The two positions do not contradict each other. The thing is that most people don't have a need for DSP, especially if their main application is word processing and most people who buy a Falcon probably will not use it for general purpose computing. (If they do, either they have an Atari software base they don't want to lose or they made a sub-optimal decision on the basis of quality/dollar.) Hoping that there are enough people interested in DSP to go for a less powerful machine than they could otherwise get is a gutsy move for Atari and I hope it works for them. (I also hope they start treating their developers with some respect and allow information about the machines actually to make it out into the public. Why not? I'm allowed to fantasize a bit. :-))

Or am I trying too hard to find some logic in this and this flame war is strictly a religious battle?

john

-> That I know, but what is it going to cost? I have heard about
-> prices above $1000...

The DSP that C= will use for the A4000 is the AT&T DSP3210. It's a very
INexpensive DSP (ie. ~60$ US in quantity of 1). It's also going to be
really modular, in the sense that the DSP board will have a socket
for one (or maybe many) daughterboard that will contain more circuitry
for each special task you want to accomplish with your DSP. For instance,
if you want to use the DSP to play&record digital sound, the
"sound-daughterboard" would add the AD/DA converter circuitry.

In short, it's going to be a really inexpensive scheme.

Alas, this has now changed. A lot. There's virtually nothing resembling Atari retail in Toronto. Atari Canada was just outside Toronto, and with them gone, all you get are PC's and Macs. The Amiga seems to be close behind. Even a big music/MIDI place called Saved by Technology, which used to sell a lot of Atari's and push Notator and Cubase, is now almost entirely Mac. They had posted on a wall a press clipping about Atari Canada closing. That hurt. They used to give Notator classes and everything. Funny though, the Mac sequencers just don't compare to Notator (of course until Notator Logic is out for Mac). They have some nice score printing software though.

> Anyone got any hard facts, or even pure speculation.

The hard facts are: you're right, the current Notator 3.1 does not work
on either the TT or the Falcon. I believe they are only bug-fixing
Notator 3.1, not developing a Falcon version. However, Notator Logic
WILL be coming out for Atari, in a couple months (after the Mac version),
and there will be an upgrade path from Emagic in the states at least.

> Does the change from C-lab -> Emagic mean Notator will no lonmger be
> supported???

NO. Notator will continue to be supported by Emagic, along with Notator
Logic. BTW, I would assume that Notator Logic for either Mac or Atari
will cost BIG bucks, it's a very large product.

>

I've used Atari lasers for about 4 years now, and find them excellent value. The
SLM804 gives _slightly_ better print quality than the 605, for both text and
graphics (but only just; maybe its just the three printers I know?)
The 605 is much sexier on the desk: smaller and quieter.
The 804's fan makes a hell of a noise, but you can shut it up by holding the
cat flap on the back open with a sheet of paper (which must be removed before
printing ;-).
I use the Diablo emulator, without any problem. Apparently the Epson emulators
have more facilities, but my word processor does it all, so why bother? I thought
these emulators were PD? If I remember rightly, you get them both with the laser anyhow ...
One last thing - they are _fast_. Not because of the engines, but because they are
hooked up thru' the DMA. Shut up your MacFriends by printing a complex graphic on a TT!

Now slow down here a moment Dave. Is this message intended at me
or is it intended to be directed to the readers of this news.group?

If it is aimed at me then I can see your point but you raise an
other element to this topic which I will respond to when I find
out WHO YOU directed this part too.

>
> > I personally do not mind if you will or will not write software for me

Oh I see now, it is not aimed at ME but at the sttitude you have
encountered. Why mix the two Dave. I still say I have no requirement
for your software and as such it does NOT effect ME in one little

bit. However you have encountered another thing here which I do
agree with the "me syndrome". But do not mix postings Dave, ok!

> Atari community is wonderfully supportive.

Wrong David! Very wrong indeed. I do care what happens to Atari
and its related developers but remember you are not the only person
in the world who has writtens software and felt the way you do.
Infact I think many developers on many platforms would say the
same thing you have. I think that saying I do not care about
what happens is total CRAP on your behalf and not even implied
in any of my posts in this news group or anywhere else for that
matter. Infact the complete reverse is the case.

Just because you have become yourself disillusioned with the Atari
platform do not take it out on those of us who will still be here
in 10 years time and you will have been long gone David. Infact the
attitude that comes out in your post here is the same that I responded
to when Chris brought up the orginal topic. Sharing notes are you?

> > The point I was raising was why do we in this news group always go
> > throught this "Convience me to stay with Atari" every few months.
>

> be such a great idea.

David, never pretend to speak for everyone else, as NO ONE has
given you a mandate to do so. Maybe David Baggett is upset but
I am not. I am happy with all the Atari machines and devices here
at this domain STaTus.gen.nz and all the other bits and pieces.

You see David people buy a computer for a reason and it is kinda
like buying a car. Just because you have a flat tyre and the price
of rubber has gone up do not lumber all of us with Wooden Wheels
and a wooden engin, that wooden go.

David, must you start like this every time? Ah well here we go
then ...

/include/flame(on)

Uninformed, now there is a BIG joke and the first of many mistakes
in this post of your David. This site...

Ibm AS400 (no not a pc David)
486dx 40 ecicon server with tcp/ip
386dx 40 fax server tcp/ip comms server
386dx 40 pc support waffle/
286 12 comms server tcp/ip
8088 12 ip router *2

Now there is just the IBM crew in here. I will point out all of
this is bar the as400 was manufactured by myself. Hmm you just have
NO idea yourself.
>
> Those of us who OWN 80x86 machines know that you don't "void the

I would not want Atari to do nor any PC firm Dave as I do it myself
and save the BIG bucks for a service contract. Well you said it, I am
sorry, your are one of the "Techno Bunnies" Dave, but hey that's life
for you mate. Having just said this and read your above quote. Dave
you seem to be telling mistruths in your postings. Calm down and take
deep breath next time mate. See your reply to my first message at the

top of this post. We did, we know you are telling fibs as we just read
the quote a few lines above. So what do YOU KNOW ABOUT IT DAVID?
NOTHING you have just told us all. (Oh why do I bother to continue?
it's fun!)

> SOMETHING INTO YOUR ST OR FALCON, and it certainly doesn't require any

731. DSP for amiga

Newsgroup: comp.sys.atari.st
Date: 1993-01-13 18:43:22 UTC
From: rosenkra@convex.com
Message-ID: <1993Jan13.184322.28420@convex.com>
Source record: 212108

i am still trying to figure out the best (digital) recording media for a
home audio studio (tape eg ADAT or TASCAM DA-88 or direct-to-disk with
falcon). while researching this, i thought this was interesting. note
that i am leaning toward tape (ADAT) since it will be turn-key. i have
some signal processing gear already (digital reverb, delays, compressor/
limiter, etc) so falcon DSP is not a real big plus, though if i could get
some straight answers on 1) availability of falcon (in US), 2) A/D and D/A
capabilities for 8 channels (eg returns, sampling rates - i'd want both
44.1 and 48 kHz - etc), i'd be inclined to look harder at falcon.
i definitely want a mixing board with knobs/sliders (Mackie 16*8 or so),
not mouse. the Mackie has >= digital specs (100+ dB S/N) so i am not worried
that it is analog. this board looks like a killer (8 subs, 6 sends, etc,
4-band parametric EQ, etc) for the $$$.

pls, don't call me an "atari flamer"...

Date: Wed, 13 Jan 1993 15:20:42 GMT
Lines: 46

Hi all again,

here we received several e-mail with questions on the TMS320c25 DSP board
that we produce.
..So keep the informations coming!

- General purpose dsp board, (not only for audio applications)
- 16 Kbytes of fast Sram zero wait states for the dsp (25ns) dual port
- Autoconfiguring for Amiga: 500, 1000, 2000 and 500+
- General purpose Serial interface
- All 16kb are memory mapped in the Amiga memory

Software pakage:

There are two software pakages:

- Minimal software for DSP using including:
- DSP.library
- Various DEMO program including HI-Speed Mandelbrot

- Professional Development Pakage including:
- Macro Assembler
- DSP.Library
- Extended DEMO pakage.
- 320c25 Assembler Manuals.
- Demo source code
- Block diagram board project

The price are:

$299.00 for Basic System (minimal pakage)
$399.00 for Professional pakage.

We are producing the board, but we have TOO orders, so we accept only
RESERVATIONS. NO MONEY ORDERS, we accept money only on shipment.
Please reserve Your DSP board with the indication of YOUR Amiga System,
at the Fax # + 39 41 957 192 or e-mailing to me.

Dave Baggett said recently that he knows of shareware term emulators for the PC that beat Uniterm. While I am sure they exist, I never seem to find _anything_ good for the PC when I browse shareware and pd.

My father has a PC, so I am always looking for interesting pd software for him. I still haven't ever found anything good. Am I looking in the wrong place? Help.

>Could someone enlighten me? I was under the impression that line A calls
>were a no-no because the newer motorola processors use the same opcodes
>that lineA does, which kills any line A calls on a newer machine...

No, you're confusing the line A (which is still available) and the line F
calls. Early versions of TOS used line F internally, and this conflicts
with the use of the line F functions by coprocessors (most notably
the 68882 floating point coprocessor in the TT). TOS 2.x, 3.x, and 4.x
no longer use line F, so coprocessors can easily be interfaced with
them. Atari never documented how line F was used by the OS, so
no user programs should ever have used these functions (a few did,
and they broke of course; as we warned them they would).

>Could someone please clear this up? I'd like to know what the story is,
>and how this relates to graphics cards and the VDI. If my above
>assumption is incorrect, what is the complete story on Line A?

The complete story on line A is as I said: it will work in ST
compatible resolutions, but not necessarily on any other resolutions
including resolutions generated by add-on graphics cards. The VDI
provides the same functionality, and at pretty much the same speed
(someone earlier claimed that the VDI was horribly slow; that's
not true, but the VDI does sometimes require a bit more thought
on the programmer's part!)

I used to be one of those who abhored GEM, and used only line A
and text calls for output. Then I finally bit the bullet and
learned the AES and VDI; and to my surprise they really aren't
hard to use at all, and the extra compatibility and functionality
are definitely worth the effort!

>about the world's greatest DTP system? I'd think that would be about
>$300 a copy if it were something as good as Interleaf, Frame maker, etc.
>
I just shelled out $180 for Pagestream 2.2, $19 for the NEOCli and $20
semthing for Zocra's Style (cause it looked neat)... Once I get back to
school and can get it set up, I should be able to give a better comparison
of Pagestream vs Interleaf, but for now, her goes...

Interleaf is the system available to me through the school's computers.
I taught myself how to use it after several hours of extreme frustration.
Interleaf is powerful. Very powerful. But it is hard to use... it in my
opinion retain that nasty "unix feel" that all unix apps seem to retain
(I love UNIX, but it is NOT easy to learn or intuitive. The average person
is going to be unable to use it well. Many unix applications that I've
used seem to retain that.) In any case I would have happily continued using
interleaf except for several things. (Many people at our school use it
exclusively). Since it runs on the schools Suns, I can not use it at home
and it is a pain to try and get on a machine at certain times of the day.
Interleaf is also a disk space hog. (Which wouldn't be bad if it only took
up space once, but interleaf eats space from my ACCOUNT as well as on the
main drive (the beastie takes about 400K in a one meg account with only six
documents saved)... It gets worse when the user is the average non-technically
inclined person who doesn't know how to delete backups periodically or how
to comprssxs files or any of a number opf things that can save space.
At the end of every semester drive space tends to get tieght because of this.
Pagestream seems to compare well i some areas but falls down in others.
Pagestream handles fonts much better than interleaf and seems to be more
intuitive to use. It uses import and export modules much like Interleaf
but is much easier to add/remove modules. (It took me about five hours to
get a GIF picture into Interleaf... I had to hunt and seek to find the
proper module and experiment with set ups + Interleaf has its own file system
which only slightly resembles UNIX...)... I can't say much about print
quality since I don't have my printer with me right now. (Actually, when
I need it, I can dump Pagestream output to a PS file and print it on the
same printer the school uses for interleaf - An HP Laserjet III...

Just some rambling thoughts...

Yes, Virginia, there is Scheme for the Atari ST. (At least the last time I checked!) EdScheme, from Schemers, Inc. is available for IBM, Mac and Atari ST, as well as their book, "The Schemer's Guide". The last time Ic called them, I think, they said that they still supported the ST, and EdScheme ran on the 1040STe. The last phone number I have for them is (305)776-7376. Good luck!

736. 'nuzzer modem question...

Newsgroup: comp.sys.atari.st

Source record: 212114

Thanks to Markus Wenzel for his corrections to previous posts ref Spectre & TT.

For those of you who don't know, Dave Small is seeking TT Beta testers. Here
is a copy of his GEnie message which was posted in AEO #93-02:
==========
I NEED TT BASED USERS TO BETA TEST. You must have good sense about
backups! We have had bugs before that have blown away partition tables,
and you MUST be able to restore your data, for your sanity and mine.
Beta Testing is a mixed bag -- ask any of the people who have done it.

If you wish to, PLEASE send me an email describing your TT outfit (I am
particularly after people with lots of TT RAM, like the GE Soft board;
I have 8 meg TT RAM in my machine with that board, and love it!) because
of some, errr, new things I would *like* to release in this next cut.

Anyway, I'd like to get the testing rolling, get this one out the door,
then move on to Spectre 4.0. I have some news you will absolutely not
believe for that one!
==========
Note that by "email" dave was referring to GEnie email where his address is
DAVESMALL. I don't recall his Internet address but I don't think he
frequents the net much anymore. His fax # is 303-791-0253.

So if you are a TT user and you are anxiously awaiting Spectre 3.1, you can
help the process by volunteering as a Beta tester.

Hmmm... I wonder what Dave has got planned for Spectre 4.0???

>by now.

Yep, DMC wrote it and Atari picked up the rights to it. It is now public domain and freely distributable as long as all the files remain intact. It should be on a.a somewhere and I know it's available on GEnie.

741. Fax-pollin with Atari ST?

Newsgroup: comp.sys.atari.st
Date: 1993-01-13 20:35:41 UTC
From: UPS500@rhrz.uni-bonn.de
Message-ID: <16B551219D.UPS500@rhrz.uni-bonn.de>
Source record: 212130

Hello everyone!

I'd like to do fax-polling with an Atari ST, meaning to say
that I would like to find a configuration, allowing for a
data dialin while normally the computer is set to receive faxes.

That way, a kind of remote controlled answering machine (only
for faxes instead of voice) could be realized.

Here's what I imagine possible solutions to the problem:

Variation 1.:

A BBS-program which could activate a TTP automatically, as
soon as a fax-call is recognized as incoming.
My special problem here: The BBS program would HAVE to be able
to operate an AUTOANSWER modem, meaning to say that it should
react to a CONNECT 2400 - prompt (or whatever speed) rather
than a RING detect.

Variation 2.:

A kind of accessory, allowing to load and interrupt the
BBS and the fax-programs alternatingly, all according to
a predifined timer. That would make it much safer to set up
a faxpolling-facility, since polling would only be possible
at certain times.

Should any of you have a solution to the problem on an ATARI,
please contact me.
Thanks

Markus Schlegel

Hi Maarten!

>Does the atari.archive, or any of its mirrors, have a mailserver?

Yes, it has, though I don't know nothing 'bout the mirrors.

The a.a.u.e.-Mailserver is accessible via 'atari@atari.archive.umich.edu'.
At least I hope so, since this info is dated March.3,1992, but since then
things seem to have changed a bit (access restrictions and things like that).

However, as far as I remember, there is a mass restriction of 400kb per 24h or
so. If you aren't looking for something special, I think it's better to use a
mail server in europe. I can name some of them, althouh there might be more:

ftp@cs.uni-sb.de
info-server@uk.ac.bath (*)
archive-server@lancs.pdsoft (*)
mail-server@rusinfo.rus.uni-stuttgart.de (!)
mail-server@cs.ruu.nl (!)
info-server@Germany.eu.net

(*) I did not test these
(!) They have lots of ATARI stuff

Hope this helps!

Read you here

Do you know ST owner's with pirated commercial programs? (not shareware)
I don't know many ST owners "in the flesh", so I don't know any who
have pirated commercial software. As far as shareware goes, it sounds
like ST owners don't pay up very often (hey, I did register blox :-),
but my point was all the commercial, non-shareware programs (word
processors, spreadsheets, compilers, comm programs) I see people
ripping off.

Of course, you could point out the lack of commercial software on the
ST as being responsible for less piracy - there's less to pirate :-)

I think the theft has arisen because of the popularity of the pc. Joe
Smoe has a pc at work, and buys one for his home. He sees his company
buy one copy of Word Perfect and install it on fifty machines. He
figures what's one more copy and installs it on his machine at home.
It gets a little easier with the second program. After a while, Joe
considers it his "right" to get free copies of commercial programs.

We've never been able to get very far either... My brother managed to cut
a huge Z-shaped incision in the patient, and dig around inside before
killing them. I think I've managed to get to the point of _seeing_ the
appendix, but I've never managed to take it out.

Is there another operation after that?

>
>Craig.

I can afford a new system, but my ancient ST does what I need it to -
mainly as a terminal to read c.s.a.s flamefests :-)

If a 68040 Falcon comes out in a reasonable timeframe, I'll get one.
Why? Music, of course. And why haven't I bought a new computer system
since '87? Music, of course. Those guitar toys are getting expensive :-)

My hard drives live in a huge NCR TOWER case that used to house an NCR TOWER. The TOWERs were 680x0 unix boxes... quite popular multi-user unix boxen! NCR's got the world's largest installed base of unix machines... they also "invented" the TOWER case, which clone manufacturers have fallen in love with.

The computer that lived in my case was a 12Mhz 68010... the motherboard was _larger_ than my ST is (a bit longer, a bit wider). The case, with a power supply, weights > 100 lbs... Empty it feels like ~60 lbs. Definitely a tank!

Hmm, maybe this thread should travel to alt.folklore.computers... They like this sort of thing.

True enough... Not a lot of pirates tend to have CD-ROMs though...
They seem to prefer 1M STs with no hard drive...

> >Precisely why I'm trying to collect as much info as possible...

Under OS/2, there's two ports of GNU C/C++... It won't even need to go
through major contortions (like you would under DOS), since it's got a
real live flat memory model, like the ST...

>Well, I tried ftping to atari.archive and got denied access, so then
>I tried ftping to wuarchive and got the same message, so I guess it
>is a true "mirror" of atari.archive :-(

As far as I remember, a.a.u.e. allows more access at non-office times. There is a directory called 'Administration' or so, containing an article about how to write a *NIX command script that does an automated ftp session at a configurable time. You could try to access a.a.u.e. late at night to get this article and then install your own 'night time ftp machine'. If you aren't working on a *NIX box, then you could try to port this batch to your OS. That should be quite easy, because I once wrote such a thing under VMS (although it might be lost now, I'm no longer working inder VMS...:-( ).

Hope this helps. Good luck!

Andreas

Only Atari or Apple would be stupid enough to try to say your warrentee
is void if you open the case. Every other system around you're
expected to do it. You know, pop in some SIMMs, since you forgot to
order your system with enough RAM?

ALL cards come with drivers. If not, ship it back. If you're an
educated consumer, and avoid the garbage (ie, ask _other_ people before
you buy; kinda like I did here), you're going to be fine. If you're
J.Q.Luser that doesn't know a SIMM from a hard drive, you're in for it.
That's true for _any_ system that the salesdroid wants to sell you.

> Just like the ST, except very few ST's applications are inside the case.

Yah, just the OS, which needs patches.

> Re best for your price. Hey Chris this applies to ALL machines and well

> a clone and there is only one made by Big Blue? Har far do we take this?

Depends... do you want a card for your AS400, or do you want a complete
computer? It'd depend on what you were looking to buy at the time. Right
now, I'm planning to buy a new system of some sort, hopefully within the
next six months. Maybe in six months, Atari will have a nice 33Mhz
32-bit Falcon030 out, and dealers. Maybe in six months, I'll have found
something that tells me, "Chris, you _need_ a [insert whatever here]."

How about this:

comp.sys.atari.st - current newsgroup
comp.sys.atari.st.tech - current newsgroup
comp.sys.atari.announce - announcements of new software/where to get it

If the Falcon takes off, add:

comp.sys.atari.falcon
comp.sys.atari.falcon.tech

Now, all you need to do is find someone willing to sit through the 6-8
month newsgroup creation process... how 'bout me, Dave Baggett, RobR,
Chris Mauritz, Gregory Carter, and Mark Kovarski? :-)

Hello, world!

I recently got a direct 19200 bps line to our school's machines, and
I'd like to know if there are any zmodem programs that can handle
file transfer at such speeds on a plain-vanilla 8MHz Mega ST.

I can do 9600 with XYZ 2.02 but when I try 19200, it doesn't seem to
detect the start of file.

The line can do XON/XOFF flow control (I think), but not RTS/CTS. And
I'd really like to use ^S with Emacs.

Xmodem, ymodem and kermit are ok too, if they can get higher than that
about 900cps I now recieve.

756. Local Atari User Group - Meeting Rescheduled to Sat Jan 16/93

Newsgroup: comp.sys.atari.st
Date: 1993-01-13 22:29:53 UTC
From: daroloso@math.uwaterloo.ca
Message-ID: <C0tD5u.G9@math.uwaterloo.ca>
Source record: 212134
Cross-posted to: kw.micro,uw.sys.atari,comp.sys.atari.st,comp.sys.atari.8bit

Due to the poor weather today, our meeting has been rescheduled.

In January, the Kitchener-Waterloo Eight Sixteen Thirty-two (KWEST)
Atari user group will have a general meeting with the spotlight on
Calendar programs.

Our 16-bit library currently has over 400 disks of public domain
and shareware software.
In addition, there will be our updated catalog disk and our
disk-of-the-month.
Our 8-bit library is also available at this meeting.

As well as our own newsletter "The Hard Copy", we will also give
attendees the December issue of AtariUser.

The group welcomes new members and visitors with
8-bits, 16-bits, or those just curious.

Meetings held at the University of Waterloo in the
Math & Computer Building.

Meeting starts at 2:00 pm.

Saturday, January 16, 1992
DCS Course Room, Room 2009 (2nd floor)

Not this crap again.....

hear-say, or heresy!?

So, a large assortment of people, reporting that they have been ripped
of by Ralph Mariano's 'business', is merely hear say is it!? These reports
are fact, why would so many people publicly lie about such a thing!?

Also, how is such a statement supposed to get me into court!? It's near
enough to the truth to be indistinguishable! (which means, you can't
tell the difference!)

The man has promised several people their hardware, and then been unable
to supply. There was an article in recent on-line magazines reporting
this information in detail. And a lot of activity (apparently) on GEnie
concerning it.

Learn to spell properly, and then maybe I might think about listening
to your "facts"!

Apology accepted!!! B^D

Anyway (but seriously, folks), you can't be serious in your attempts to
justify (or even downplay) the level of piracy in the IBM world! You want
evidence? Just ask the guy on the street...:
You: Hey buddy, what computer you have?
Buddy: PC. Its a piece of shit!! (Well maybe not this line...B^D)
Buddy(revised): PC.
You: Where do you get your software??
Buddy: From friends or the officei. <--- Piracy is clearly meant!
The truth is, I respect you and all, but I just can't reconcile the picture
of Atarian's pirating as much as you say they do. Even if the percentage
of pirateers (like the terminology?) were the same (which I highly doubt) in
both platforms, look at the amount of users on the other platform. I could
even use a different analogy....
The amount of MAC users are surely higher than Atari users, right? They are
, I could go so far as to say, almost as popular as the IBM platform. Yet you
don't hear of piracy as much as in the IBM platform! I have a lot of friends
with Macs (and if you're gonna say things like "Since you say it's true, it
must be right", all I need to say is :"TAKE A POLL" or "ASK ANYBODY" or even
"DON'T DRINK AND DRIVE" oops, that shouldn't have been there... well you get
my point - hopefully). Even the Amiga doesn't have as big a problem with

piracy. Its ironic what happened today...(sorry to bore, but its relevant)
(we had to buy a statistics program for class)
(note: the software was for a pc)
(note2: the software cost $60)
Friend: Hey, why don't we all pitch in a buck, buy the software, copy it, and then return it saying we don't need it???? (He was talking to the whole class)
Class : Yeah sure! (I am not joking - this is actually what happened. And if personal experience does not hack it as proof, what about your little trip to Atari?? Not trying to flame bait, but trying to prove a point)

The point is, I don't need to PROVE it to you. You can PROVE it to yourself.

About my post having no info.., I am a little offended by that. B^(
Since when did comparing computers with commercial products not constitute information? Do you REALLY need to know what samplers they were? Oh yeah, I forgot, all I say is "I KNOW its true". Well somebody's backed me up on this one (re:samplers), a few posts back. And if you reeely want, I'll tell the price and brand/make (specs even) of the sampler I had in mind.

More later.

Apart from the 'rude words' (for want of a better name 8-) - not that I
care). That message showed a lot of sense. People will complain no
matter how good or bad a machine is, if it doesn't arrive on time, and
isn't exactly as promised (or better) - then it's not good enough!

Nice to see you are a T2 fan!

As I've said before, I'd love to get a great machine like the falcon,
but I just can't afford one! 8-(

From: lehmann@cs.tamu.edu
Message-ID: <1j277cINNt88@tamsun.tamu.edu>
Source record: 212138

Well, I am going to break down and use this wonderful dazzling favorite computer of mine for a real world task.

I would like to manage my budget and taes on it.

So what are your recommendations?

What is a good checkbook balancing program? I was thinking of just using the OPUS speadsheet. Is there something better?

What about a 1992 US TAX preparation program? I have a PC Speed program that can run Parsons Personal Tax Edge program, but I have to use DOS for that and the screen picture will probably look bad. If I am going to shell out several dollars for a program (and I will only use a commercial program for TAXes) I'd like it to use the GEM facilities.

Does the tax program print out pages that can be directly submitted to the IRS?

Hm, how exactly do these binaries groups work? --Are they exclusively limited to broadcasting things that have been submitted to the moderator? Or can the moderator go into the archives and post some interesting things from there? Like, for example, a series of editors, or shells, interesting languages.

Sure, it's easier to ftp, but a lot of us don't have ftp access.

>place? Help.

Ask for info and ye shall receive. FTP version 4.00 of Telemate from
garbo.uwasa.fi. Qmodem and Robocomm are also good, depending on what
you want to do.

Though I like Uniterm, it has a few dreadful omissions, the worst of
which being lack of Zmodem support. (Or support for external transfer
protocols.)

768. Mail utility for MiNT/INIT ?

Newsgroup: comp.sys.atari.st
Date: 1993-01-13 23:38:00 UTC
From: Andreas_Hoffmann@k.maus.de
Message-ID: <A54037@K.maus.de>
Source record: 212142

Hi folks!

Just recently I installed MiNT 0.95 and INIT 1.0 from the MiNT distribution kit I found on a.a.u.e.. _WHOW!_!!! Connecting a AT286 via modem1, I had a real multiuser system on my ST, behaving like a EUNUCHS box. But then, there was no mail utility included. Has anyone seen a mail utility for MiNT/INIT? (well... I am the only (lonely) user on my system, and the two terminals stand cosy side by side, but I'm kind of pedantic...:-))

If any kind soul knows how to mail on a MultiMiNT system, please let me know how and where to get it from (mail servers preferred, because I don't have easy access to ftp).

Thanks in advance.

Andreas

>Anyway (but seriously, folks), you can't be serious in your attempts to
>justify (or even downplay) the level of piracy in the IBM world!

I'm not trying to *justify* piracy; I'm simply saying that in the
absence of any evidence, I assume that piracy is about equal across all
machines, percentagewise. There is a tacit claim in your post that
your best guess about the situation (with no data) is better than
mine. Why do you think you know so much more?

>Just ask the guy on the street...:

A little dialogue you make up is not evidence of anything. The fact
is that without looking up some studies done in books or magazines
(if they exist), we will never really know how much piracy goes on.
I do get the sense that piracy is much less rampant than it was in
my Atari 800 days, but who knows, maybe the pirates just hide their
boards better. I'm not about to make a sweeping assertion on the
basis of purely anecdotal evidence -- that won't convince anyone,
just as you aren't convincing me by recasting the same ideas in
different light.

>The truth is, I respect you and all, but I just can't reconcile the picture
>of Atarian's pirating as much as you say they do. Even if the percentage
>of pirateers (like the terminology?) were the same (which I highly doubt) in
>both platforms, look at the amount of users on the other platform. I could
>even use a different analogy....

You are *completely* twisting my words around. I *never* said Atarians
pirate a lot; I just said that I don't *think* they pirate any more or
less than PC, Mac, or Amiga owners do. Note that I never tried to
force my belief on you -- YOU claim that my guess MUST be wrong. I
claim that I have no idea, but that I don't think you should go around
tacitly assuming you're right about the piracy issue without having any
facts to support your belief.

>with Macs (and if you're gonna say things like "Since you say it's true, it
>must be right", all I need to say is :"TAKE A POLL" or "ASK ANYBODY" or even
>"DON'T DRINK AND DRIVE" oops, that shouldn't have been there... well you get
>my point - hopefully).

You're missing the point that I have no reson to prove anything to you,
because I'm not asserting that I'm JUST ABSOLUTELY CORRECT on the
issue. I'm saying I *don't know*, though I do have a "feeling," which,
again, I wouldn't use in (say) an argument against Atari's or Atari
owners because I have no facts to verify my *feeling* with. YOU, on

the other hand, DO have a burden of proof here, because you are asserting that PC piracy is much worse than ST piracy. I'm saying "you shouldn't use that as an argument because you don't know for sure." You're saying, "I'm right, and even though I can't substantiate it in any tangible way, I'm going to continue using it as an argument against PC's, PC owners, etc."

It's similar to someone saying "Blondes are all stupid airheads -- just pick one and talk to her/him. It's clearly true!" That is a dangerous and unfair generalization that someone might *really* *truly* belive on the basis of personal experience, but which is completely groundless from a factual standpoint.

>The point is, I don't need to PROVE it to you. You can PROVE it to yourself.

I CAN, yes, but I have no burden of proof, whereas you do. I don't have to PROVE anything when I assert that you shouldn't argue on the basis of no real information. Your job is harder.

>About my post having no info.., I am a little offended by that. B^(

I apologize if you took that to be a mean comment. I didn't mean it that way; I only wanted to make clear that I thought you were dodging the real issue, which is FACT vs. OPINION.

whoever says Flash is a piece of junk is obviously not a user. I have used Flash since it first came out. In the meantime I bought Interlink, Masterlink, Stalker, STtalk and got Uniterm offline. In the end, I always go back to Flash 1.6. It is easier to use than any of the other programs, and extremely reliable . I hear that Flash II is not really an upgrade. Pity. Flash could use some Zmodem support and ANSI color graphics emulatuion and that would be about all.
I work with Macs, with MSDOS and with Commodore 128s (oh yes-- and a dec pdp11/34) so I am not an amateur. None of the machines have anything as good as flash, although Smartcom in the MAC is easier to use. ProComm on the IBM is about 75% as good overall.
Stalker is very nice because it can run as an accessory. If Flash could be configured to do that I would be happy. Why don't the original programmers of Flash rejig the code and bring it a little more up to date? (And please, please please NEVER brag about such things as "super powerful scripting capabilities using a C-like language" and such. My grandchildren can use Flash, and so can I and most normal users. We are the market. Not porgrammers.

>
>--
>
>ken@isgtec.com [...!uunet.ca!isgtec!ken] Ken Newman

Saved by Technology have been anti-Atari for quite a long time now...It was
one of the biggest reasons I didn't buy any of my setup there. Steve's I think
still sells software (last time I looked they had Notator & some Steinberg
stuff) Anyway, for sequencer stuff, Emagic has a main outlet on Caledonia St.
(Thats right by my house!!) And my retailer still supports Atari - I have been
flogging their store for a while now...B^D They also support Amiga and PC
though...B^(...Oh well, just have to live with 'em.
Most of the people I know who are "into" music seem to think that Atari is
only a "starter" computer for MIDI!! Almost all of them would "upgrade" to
a MAC, providing they got their hands on cash. Its ironic that software on the
Atari for sequencing and stuff is so much better, though...
Anyway....If you wanted to know my dealers address, e-mail me. If enough of you
want me to, I'll post the address (again!!). For all who don't know, the store
I go to is having a Falcon demo "week", so if anymore people want info...just
e-mail...

AcEzE.
ps. Sorry to anyone who's reading this stuff from me again, but I'm damned if
I'm going to sit still and watch the Falcon crash&burn without some sort of
user support and enthusiasm.

> The VDI
>provides the same functionality, and at pretty much the same speed
>(someone earlier claimed that the VDI was horribly slow; that's
>not true, but the VDI does sometimes require a bit more thought
>on the programmer's part!)

yo, eric...

if this is the case, could you play around with VDI and tell me how to get MGIF to work with VDI only (rather than XBIOS/LineA)? ie the fast flicker. my attempts (with some thought, not deep thought :-) showed VDI to be 3-4x slower and hence unacceptable. the problem is to blit images (potentially the size of the screen) fast enough (10 to 15 frames/sec or more) so that it appears continuous.

this has been the main reason i have not touched MGIF for a year. ie, if it does not run under AES/VDI only, it won't run on some configs, or why bother? u could argue that MGIF is really for mono only anyway, so this might not be a big deal. then again, there is no reason why it can't also work for color...

ciao

like the title says .... what should we do and what is it good for ?

i mean what purpose does a dsp board for the amiga mean to us.
it's nice for them but i only see it as a futile attempt to be current
in computer inovations
i am sorry thats how i feel ... it is good they brought it out though

>Warwick! I was beginning to feel let down that you weren't
>contributing anymore!

Well, I'm back from holidays now [Hi all!], so you can't write rubbish
anymore without getting caught.

>the Falcon, it's already a bit behind the times, but it'll certainly be
>a vast improvement over the ST. If Atari sells the Falcon for $250,
>I'll buy one. How's that? THAT would be competitive.

You were talking about APPLES, Dave. For each Atari computer (including
the Falcon), the Mac HARDWARE equivalent is more expensive, that is in
terms of raw power, which is what you claim to want.

$250 for the Falcon wouldn't be "competitive" - it would be ludicrous.

You still think base model Falcon's are like base model PC-clones, don't
you? Ignore DSP, ignore sound hardware, etc.

Why don't you just you just go out and buy a 68040 chips and stare
at it, amazed at the power in you possession.

If the Falcon was a 68030, 16MHz, VGA machine, yes, $250 would be about
the price I'd pay too. But throw in enough extra HW to make it a decent
base machine for developers to design to, and it costs $800 minumum.

In my experience, cheap PC-clones are flaky. You STILL get what you pay
for, even with the low prices of The Clones.

>>Check out the prices 1040STe's are being flogged
>>off at by long-term Atari dealers - it's a runout sale. I picked up
>>a SM146 for $AU190, which is quite a saving!! They're all about to
>>become obsolete [though the SM146 is a *nice* monitor!].

>ST's are being dumped left and right because they're becoming door
>stops.

Groan. I thought you might say that. That's why I said "long-term"
Atari dealers. Dealers are getting rid of the old machines because
the will be obsolete in 2 months. Tandy (Radio Shack) are selling
1040STe's with 130 programs for a BARGAIN (whatever that means for
obsolete machines).

>>Smell some roses for a change.
>This is finally getting fun again! :)
You should try programming. :P

Phew. Okay, I agree: all resolution-independent programs should use VDI.

All this means is that some older programs can only run as well as they used
to (except a bit faster) - gaining nothing from newer resolution.

779. Re: I'm with Dave (was Re: A letter to Dave Bagget)t

Newsgroup: comp.sys.atari.st
Date: 1993-01-14 03:00:07 UTC
From: hoffman@tsla.noava.lisc.lockheed.com
Message-ID: <1993Jan14.030007.2860@tsla.noava.lisc.lockheed.com>
Source record: 212256

I think that anyone who bought an ST bought it because it was a good machine. More than good actually when it came out it was significantly superior to DOS machines at the time. Even the Mac's weren't as good overall. They weren't color and they were expensive. But unfortunately that's ancient history now. I have been an Atari supporter and user but I'm also a realist. Fact is that in today's market the Falcon isn't going to make Atari a booming success. The PC market competition is just to high. This means that I don't believe it is possible to win the power without the price game.

Today, the PC's are still slightly inferior to the Atari in basic OS and processor architecture as imposed by DOS. But this situation is largely hidden by Windows. I also don't care what anyone says windows is not rediculously slow. On a 386/33 with a standard VGA running at 1024x768 I rarely get frustrated at the speed. If I did there are accelerators that will make screen updates fly! I use PC's, Macs, and STs every day. In fact I have a PC and Mac on my desk at work and exclusively use my ST at home. Anyway back to my point, all the problems with a PC that might have made an Atari potentially better are being fixed. DOS is going to die. There are several Multitasking 32bit OSs that will replace it. This will kill the ST or even the Falcon market.

I think that the Falcon with Multitos when it comes out will keep Atari around for awhile. The Falcon is a pretty good machine and for the price it is competitive with anything you can buy that is PC based. Unfortunately it's future looks very dim because it isn't better than the PC and it doesn't have the software base to compete with the PC.

So much as I regret it I will almost certainly buy a PC clone soon. Even though my heart says Falcon my Brain says PC. I'm afraid anyone buying a new Atari is living in a dream.

>>John
>>--
>
>is still a pretty weenie number--better than 200, but not very much at all for
>a decent production line. And is that 800 spread over the entire planet?

You are right. I'm pretty perceptive when it comes to people pulling the
wool over my eyes and I think this is one of those times.

800 machines is NOTHING. In November, Sam Tramiel said that he saw them
coming off of the production lines. Atari should have a hell of a lot
more than 800 machines!

I'm talking 10,000 systems.

Something is going on... Either Atari has redesigned the Falcon030 and
is gearing the factories up for this new system, or Atari has been waiting
for a new chip that they finished.

I'm going to guess that there are around 200 Falcon030s in the hands
of developers and publications.

And if what we are hearing is true about the 800 systems, that would
mean that Atari has produced around 1,000 Falcons total.

If Atari announced this computer WAY back in September and has ONLY produced
1,000 some systems, there has to be something going on or something
SERIOUSLY wrong.

Meanwhile folks, Commodore is expanding their market share and bank account
with their new A1200. C'mon Atari, you mean to tell me that you had
no clue that Commodore would have something in response to the Falcon030?

I mean, the Falcon030 rumors gave them 9 months to respond.

gbcusg@gpu.utcs.utoronto.ca (I. Barnett) writes:

>Yes, Line-A is considered un-Kosher programming...The official word from
>Atari is: use VDI calls (painfully slow).

There is no reason why VDI calls should be any slower than LineA calls.

In fact, the VDI calls could easily be MORE efficient. For example,
to draw multiple point with LineA, you must call PutPixel [Linea1()]
for each pixel, while with VDI, they can be passed in an array to VDI,
which could [possibly] take advantage of batch processing.

In my experience, VDI isn't so much *SLOW* as it is *COMPLEX*. A C++
VDI class simplifies things greatly :-).

All I've used LineA for is the simple PutPixel/GetPixel routines.

I prefer two completely separate modes of programming:

1. Low-level compliance (use XBIOS, then make assumptions
about screen-memory bitplane-layout).
2. High-level compliance (use AES and VDI).

ie. Games and Applications.

Appologies to all that STrabble doesn't run in resolutions other than
STMedium and STHigh. If I had to write it again, I'd do it properly.

We are currently in the process of replacing IBM PCs at work with STs. They are simply easier to use and we don't seem to have any difficulty getting software or service in our area for Atari. I realize that they are no longer a state-of-the-art machine, but I don't have the time to fiddle with the computers to make them do things that we don't really need to do.

For myself, I will wait and buy a Falcon when they do finally become available here. I thouroughly enjoyed my old ST (I dumped my IBM PC in favor of it) and also enjoy the Mega STe that replaced it. It does everything that I need done in a reasonable amount of time with an appearant minimum of effort. I think I will enjoy some of the extra features that the Falcon will have to offer. I do realize that for some things I will only have a choice of one or at best a few programs instead of many, but most ST software I have used has been of good quality and very reasonably priced. My dollars will go to Atari for now.

P.S. Yes I/we also own PCs and use them daily for their assigned tasks as they make dirt cheap and reliable file servers for our rather simple minded databases.

Um, OS/2 sold well over 1 million copies in 1992. That isn't bad considering it came out at the end of the 1st quarter. Also, when was the last time Atari offered bug fixes and beta copies of future releases of its operating system by FTP? That's right, you can get OS/2 2.1 by anonymous FTP from ftp-os2.nmsu.edu. Not only that, users of OS/2 2.0 can get the service pack there also (which corrects some bugs which were found in 2.0). Also, Apple offers their OS by FTP also (on ftp.apple.com).

788. 1040 problems

Newsgroup: comp.sys.atari.st
Date: 1993-01-14 05:05:22 UTC
From: SML108@psuvm.psu.edu
Message-ID: <93014.000522SML108@psuvm.psu.edu>
Source record: 212263

Hi, the problems I previously posted as arising from my hard drive may be instead based in the 1040ST I have just acquired...

Here's a quick re-description...
I have a seagate ST157N hooked to an ST host adaptor in an ICD FAST drive. When this drive is used with my TOS 1.4 520ST, it works fine. When it is used with my new TOS 1.2 1040ST, it gives frequent write sense errors, leading to it being less than optimally useful... Any ideas?

Scott

>computing.

If people's main applications is word processing, just about anything
will do. The DSP is useful for more than just sound. Anyone who wants
so view images could gain greatly by having a DSP to implement JPEG
[de]compression.

Anyone who wants a modem will also benefit by having the modem implemented
in software - using the DSP to produce the analog signals for the phone-line.

John, all you comments would be valid, except that a DSP is not a niche
processor.

>The current "Power without the Price" system is probably some 486/50
>box from (hopefully, a reputable) mail-order dealer (like Gateway)
>running Linux and color X.

And that's all. No applications software whoatsoever. It's still only
a 386-Unix-hackers toy, John.

I worry about what will happen to the company because of this. At this point it seems very short-sighted to assume that the situation you describe will continue. For the same reason you can't get this kind of support for a VIC-20 now, you may not be able to get any software or service for your Atari computers in the not-so-distant future.

>I do realize that for some things I will only have a choice of one or
>at best a few programs instead of many, but most ST software I have
>used has been of good quality and very reasonably priced.

The problem is not that you will end up with few choices, but that you may end up with none. Developers are leaving the Atari world, and they're not being replaced. The fewer developers you have, the less software gets sold, and the less attractive the market is to developers. Eventually they're may not be any developers writing the software you need.

Consider the current status of the Atari 800 world: it's a small, close-knit group of fans who have to live with writing their own software or not having new applications. (And the 800 is a much better-designed machine than the ST.)

George Frajkor writes:

>Why don't the original programmers of Flash rejig the code and bring it
>a little more up to date?

Actually, Alan Page, the original author of Flash has been working on a completely new telecommunications program called STORM, originally to have been released through Double Click Software before they closed down.

Unfortunately, Alan has now found a "real" job which has the potential of paying for food and rent, so STORM is on the "back burner"...

(Unfortunate for us, fortunate for Alan..)

STORM has all the things everyone wished Flash had (Including ZMODEM) except perhaps emulation for all the esoteric terminals UniTerm seems to support.

>DOS is written by Microsoft, which, when I last looked was NOT a subsidiary
>of IBM.

Well, golly gee, Warwick.. the DOS 4.01 disks that came with my IBM PS/2
say IBM on them.. they contain PC-DOS 4.01, which is an IBM product,
NOT a MicroSoft product.. so I guess you're wrong.. sorry..

Dave's point is that an ST, as it comes out of the box has *no* CLI
at all.. there's absolutely no way to issue commands to the computer
other than by clicking on icons and windows.

Sounds like *you're* grasping at straws trying to refute that...

(Actually, I've lost track of what exactly the point of any of this is..)

BobR

(Incidentally, this subject line of this message does *not* contain the
word ADVOCACY, mainly just to annoy Warwick..)

Concerning the Falcon (like half the other nonsense on this board):
If it does fail as badly as everyone is predicting, then I'll be
able to get one without spending an arm and a leg, and it will still
do what I want (read as: direct to disk recording at a sane price).
If it's successful, then I'll be able to get one anyway, if at a
somewhat less bargain basement price. If it's gone entirely, I have
no doubt that someone else will pick up the idea and run with it,
then I'll buy that system. If poor Falcon marketing kills Atari, I
think it will be bought out by someone else for a song, and perhaps
they will make something out of the Falcon as a low-end machine.

>> considerable expense.
d>
d> Actually, no. Epsilon Emacs runs considerably faster than Tempus on a
d> lowly 286/12, which is probably as slow as (of not slower than) the
d> 8Mhz 68000 in the ST. Epsilon is also programmable in C, lets you edit
d> multi-megabyte files quickly and easily, and just generally impresses
d> the hell out of me. It's a programming marvel -- proof that even
d> Intel-clone sellouts can write kick-butt code. (And you thought they
d> were all mindless drones, didn't you?)
d>
d> Faster than Tempus on a 286/12, yup. But you should see it run on a
d> 486/33!

smile but start it up in a graphical mode, where it has ~32K to move to scroll the screen, or better still, an arbitrarily-sized region in the middle of the screen, rather than ~4K (or maybe a little more if you use a decent video mode).

Tempus _still_ kicks some serious ass when it comes to speed (I can sort the entire Fidonet nodelist in <5 seconds, and there aren't all that many text files you find that are bigger 8) - and TempusWord is _scary_.

Sounds like a neat editor - is it a "real" emacs, or are they just hitching a free ride on the name?

d> If you don't like Windows, DON'T RUN IT. I never use Windows. I hate
d> it. If I wanted a GUI I'd use a Mac; at least they have a decent one.
d> PC software that supports Windows always comes with a DOS interface
d> too. You don't HAVE to have Windows.

Yay! You got my support there - although there _are_ some otherwise good and useful packages that no longer come with character-mode interfaces 8(. Whatever happened to "runtime windows"? did it ever appear?

d> Epsilon is an example of this better software. Boycott Microsoft if
d> you don't like them, but don't take your hatred of them out on the
d> Intel machines themselves.

Nice summation. Pity that I hate the hardware too tho. 8-)

Not at all..!! We need as many different thoughts and opinions on all these things as we can get..!

There are far too few voices being heard here.. we need to hear from everyone who's affected by the events we're seeing.

>Atari needs to find some way of bringing the second kind of choice back
>to their side of the equation.

Exactly..! If Atari could only produce the Falcon in sufficient quantities, deliver them to sales outlets, and market them to the general public, it wouldn't matter whether they have 16 bit or 32 bit busses, or VGA or SuperVGA graphics..

All that could follow eventually.. what they need to do is get *something* out in front of the buying public..

>are not the best computers in the world. Period.

I think that a lot of what are being perceived as "Anti-Atari" messages
and arguments here are nothing more than attempts to correct the volumes
of misinformation and misinformed opinions that have been put forth in
an attempt to show that "my computer is better than your computer"...

I certainly don't think the IBM PC or any of its clones is the "best
computer in the world", but I do acknowledge that there are an awfully
lot of things going for them. Far more things than are going for the
Atari ST... which I *DID* used to think might have had a chance of
becoming the "best computer in the world"...

Unfortunately, the "parents" of the ST locked it in a closet and refused
to admit that their "child" might actually be something with some kind
of worth to anyone else...

Yes, in the latest Atari Explorer Online, Bob Brodie says he expects to have deliverable copies within about a week. He also confirmed that it will be made available for 68000-based ST users, in addition to the TT030 and Falcon030.

>
>I forgot the price he said it was going to be sold for, but the
>number $137 sticks in my mind.

Bob Brodie says the pricing has not been decided yet, but he said one option was to upload it to GEnie for access (remember how they did FontGDOS?). Everyone in the RTC responded positively to this idea (makes sense, I suppose :-), so with any luck Bob will be able to carry his weight with the upper management and get MultiTOS available for this type of distribution.

Funny isn't it, how the very word "Atari" can rot some peoples' brains..

You might meet them on the street and think they look fairly normal, but say anything that even remotely challenges their imagined "Atari utopia" and they completely flip out... "Hope your penis shrivels up" is about the best you can expect from them... logic and clear arguments are a lost cause...

Once again.. my position is that the PC was DESIGNED from the first to be expandable.. the ST was NOT.

Regardless of what difficulties might be encountered in upgrading a PC, they are trivial compared to having to wield soldering iron and hacksaw to upgrade an ST.

(Maybe I should dedicate a macro key to this, eh..?)

811. Which ST Sampler?

Newsgroup: comp.sys.atari.st
Date: 1993-01-14 09:41:31 UTC
From: mcsdc1ph@dct.ac.uk
Message-ID: <1993Jan14.094131.2782@dct.ac.uk>
Source record: 212292

Hi.

A few suggestions to my dilemma would come in handy:

I want to buy a sampler for STe tracker uses, and my local stockist has two available. Mastersound II, and Stereo Master.
Does anyone have either of these? Which would you recommend?
Both are priced at 39.95p (Although I'll probably get it for 29.95)
I have just started writing tracker music with my STe, and feel very limited without a sampler, and so basically want one that will cater for all the needs of a musician (like finetuning of samples,etc), an also because I want one that looks very professional and glitzy! (sorry)

I have both TCB tracker and NoiseTracker.

One more thing, I saw a program on the Amobea which allows you to load up a game, etc, reset, load the routine, which will search for .MODS and/or samples, and allow you to save them off.

Is there such a proggy for ST?

I want one for basically two reasons: One, there are many nice samples used in certain games, that I would like to use myself.
Two: A lot of ST-Tracker game music is ported from stinking Amobeas, with in game tracker music included in the file. Now as we all know, there are very few ST (STE too, which aggrivates me to hell!) games which have in-game tracker music, merely the abominable crap-chip noise.
BASICALLY! It would be nice to hear all those other tunes from ST!
They do do this, because I've got a rip of the BEAST 2 music, which features all the amiga music from in game as well as the title theme. (Which is all that we got!)

Sorry for gibbering on,

I'd be grateful if you could help!

Feekzoid

To answer your serious question here, yes I will buy the Falcon, as I think it is the only machine which has got its act together.
Reasons:
1. It uses Motorola chips and not the Intel Chips (designed by idiots).
2. The DSP chip in the Falcon comes in handy in decoding WEFAX and RTTY signals from my HAM radio.
3. I am very satisfied with Atari machines. I have been using an ST for the last 5 years, and the machine has never let me down so far.
4. I am sick of using PC's, which is a standard here at my workplace. I have done installations of S/W and H/W on about thirty PC`s and I must say it needs a hell of a lot of knowledge about the machine before you can get all the apps to work correctly with each other.
What bugs me most about these stupid machines, is the memory layout. 'Normal memory`, High Memory`, Extended, Expanded, and for the last three you always need special drivers, which eat into your idiot 640k memory.
I prefer having the OS in ROM, and having the full RAM available for Apps, not having to install all kinds of crap to get the system running and eating up my memory.
5. The windowing systems in use today on PC`s is no more sophisticated than GEM, in fact I prefer GEM, at least I know where to find things. Windows needs all kinds of setup specials like Pif files. The file manager in Windows is crap, try copying a file from one directory to another.
OS/2 is another one of these badly written OS`s with a level of complexity which puts even Messy-Dos and Messy-Windows to shame.
6. I have no need for programs written for PC`s, all the programs I run on my ST are good enough for me, I never get the `Out of memory` message on my ST, which happens quite frequently on PC`s.
7. Apps written for ST's usually cater for people with minimal machines, on PC`s the programs you get nowadays assume you have at least umpteen Megs of memory and consequently need a fast processor. (Why can`t people write small and fast apps anymore? I had some beautiful S/W running on my 48K Spectrum!)

I could go on and on with this, but will leave it for now. Hope it helps.

I'm not sure WHY this point has to be made. After all, the Macintosh "out of the box" has *no* CLI at all either. Does this make the Macintosh an inferior computer?

I got TOS 2.05 with my MegaSTE and I've stopped using NeoDesk 3 to use NewDesk(TM!)... then new version of the Atari Desktop. Once you've set up some decent icons and keyboard shortcuts and window colours etc. it's very nice and I think it's a lot tidier than NeoDesk.

But it's all a matter of personal opinion. I looked at Gemini, went "ugh, big icons!" and got rid of me, but that's just me. As long as the straight GEM desktop comes close to the replacements, I'll use the official version.

Cue desktop flamewar, I fear.

>show case machine!!

It is useful having a reasonable screen resolution. Have you ever tried using
Windows? When you get into the world of multi-tasking, you'll have more
than one window on the screen at a time (a different program in each one).
You need to have a decent resolution so you can see each window clearly.
I'm a bit ignorant about the Falcons capabilities (i'm ignoring it until
it actually exists in the shops to buy (not necessarily the shops here,
I doubt it'll ever be here at all, the market is dominated by PC's, Amiga's
& Mac's here.. aparently there's not even an Atari distributor in the
country any more.)) but could someone tell me, how would the falcons
screen resolution handle several windows on the screen at once?

Craig.

Source record: 212051

: no-one is going to convince
: me that direct FDC/DMA access is a better way of loading your data than using
: system calls. It ties the program to floppy and if software timing loops are
: used then it fails on a faster machine. If programmers had avoided such brain
: damage then maybe today we'd have really big games that install on HD.

You seem to have forgotten the problem of copy protection. The difference between the PC and The St is that on the PC it is expected that the owner
has a hard drive attached, which is not a reasonable asumption upon the ST and so the programmer must be aware that the game will be played from floppies.
As such he must protect them from being copied and so must screw the disks up completely therefore using the system calls would be a tiny smidgen obvious.
(Sorry, sarcasm is not really called for)

: There are very few reasons why a game has to take over the whole machine.
: Why can't we have programs that run from hard disk, go into whatever
: resolution they want, play, and then quit back to the original desktop.

Agreed Totally!! But only if the games world decided to either completly
forget copy protection (might even cut down on piracy) or go to some other form.

: If programmers of simulators like Falcon or Formula One Grand Prix had obeyed
: some simple rules think how much their programs would benefit from the extra
: speed of the Falcon030.

: No, I'm afraid there is just no excuse for bad programming.

No Excuse what so ever, But remeber what they have got to cope with!!

Paul. (No fancy quote as yet)

|> Is there such a proggy for ST?
|>
|> Feekzoid

If I'm right, Stereo Master is the new version of Mastersound, so it'd make sence to buy that if they're the same sound.

These days I suspect games programmers will be attatching memory blankers to the RESET vector, but a program to dump memory to disk attached to the screen would be possible...

<thinks>

Boot sector driven games would be a problem and also I doubt a game would bother leaving alone a malloced block of memory.

But it should be possible somehow!

David.

It's just MS-DOS, I imagine, but it's still an IBM-distributed CLI for
PC's. If Atari bundled a copy of Gulam with every ST it would be the
same thing. They don't do that, and therefore there's no official,
Atari-sanctioned standard CLI that you can always assume people will
have.

>This is true. Out of curiosity, though, does the Mac come with a CLI

Not really, though Apple's MPW programmer's kit comes with a CLI.

NO NO NO NO NO NO NO NO NO NO NO NO NO NO NO NO NO NO NO NO NO NO NO NO

You have taken something I said and completed changed it around. This
just goes back to Bob's comment that any gripe I have with you guys
on factual points gets turned into "another reason I hate Atari,"
which is absolutely not the case.

The CLI point was simply to illustrate that faulting "DOS" machines
because they run DOS is unfair, because no matter how bad DOS may be,
it's better than the Atari-sanctioned equivalent, which is nothing.
The fact is that it is INANE to belittle the PC because it runs DOS.
You don't have to run DOS, just as you don't have to run the vanilla
GEM desktop on the ST or Hypercard stacks on the Mac.

>And Dave, since you seem pretty good at this flame lark, you're not perchance
>one of the more well known flamers from alt.flame are you? (Posting under
>a different id of course).

I haven't been flaming anyone, though I've certainly been called a
lot of nasty things. *I* am just saying things that are my opinions
(one's I think are supportable with a reasonable amount of evidence)
that you just don't like to hear because they point out what's wrong
with your favorite computer (in a few cases), or, more often, what's
NOT wrong about other computers by comparison.

The people who view me as anti-Atari just because I challenge outright
lies made here about PC's and Mac's are the one's who are turning this
into a flame war. *I* never told anyone they "needed to laid," or that
someone else was a "Techno Bunny" because they refused to believe me.
Those things are from the keyboards of people who fail to mention.

>PC clones! Ha! I get much better performance on my Cray!

The reason these things turn into flame wars is because people who have
no understanding of argumentation make obscene generalizations like
this one without thinking about what they're saying. Crays are far
superior machines, yes, but I wouldn't suggest that they're the "best
bang for the buck," and they're not in the personal computer price
range. PC clones are -- you can get a complete PC system for less than
the Falcon will cost you.

Atari DMA chip drivers have been marginal from the beginning. The standard
Atari DMA cable is only 18 inches long. It is quite possible that the ICD
cable which works on your 520 fails on the 1040.

See if you can borrow an official short Atari cable and see if it gets better.
Also, ICD may have an upgrade available for the cable you have.

PS: be glad you get write sense errors. The original SH204 wouldn't even
report errors.

830. New perl 4.035 version for Atari available on a.a.u.e

Newsgroup: comp.sys.atari.st
Date: 1993-01-14 15:28:11 UTC
From: ridderbusch.pad@sni-usa.com
Message-ID: <RIDDERBUSCH.PAD.93Jan14152811@nordpol.sni.de>
Source record: 212073

I've uploaded new versions of J.R.Bammi's latest and greatest perl
4.035 port for the Atari computers (actually Martin did the ftp`ing;
thanks Martin).

```
They are available from atari.archive.umich.edu in the directory
atari/New. It is most likely, that the three archives will move to the
proper location soon.

Here is the 'readme' from the archives of the executables:
============================================================
* Tue Jan 12 15:32:00 1993

This archive contain the most upto date Atari version of perl
4.035. Jwahar Bammi send his latest improvements to me and I
compiled versions for TOS and MiNT with GCC 2.3.3. I created 3
archives:

- mperl.zoo: This file contains the MiNT specific version of
perl.
- tperl.zoo: This file contains the TOS specific version of
perl.
- slperl.zoo: This archive contains the changes for the Atari
version relative to the full perl distribution.
Also included is the 'lib' directory from the
perl distribution with the various perl
packages. I've also included a formatted ascii
version of the perl manual page.

So, to actually make good use of perl you either need
'mperl.zoo' or 'tperl.zoo' and 'slperl.zoo'. The complete
source distribution of perl 4.035 is available from nearly
every ftp server around the world.

Executing RCS 'ident' command on the TOS executables produces
the following output:

echo.ttp:
$PatchLevel: atariST/TT-TOS Gnulib: 86 $

perl.ttp:
$RCSfile: perl.c,v $
$Revision: 4.0.1.7 $
$Date: 92/06/08 14:50:39 $
$PatchLevel: atariST/TT PML: 20 $
$PatchLevel: atariST/TT-TOS Gnulib: 86 $
```

perlglob.ttp:
$PatchLevel: atariST/TT-TOS Gnulib: 86 $

Executing RCS 'ident' command on the MiNT executables produces
the following output:

echo.ttp:
$Patchlevel: MiNT library: 25 $

mperl.ttp:
$RCSfile: perl.c,v $
$Revision: 4.0.1.7 $
$Date: 92/06/08 14:50:39 $
$PatchLevel: atariST/TT PML: 20 $
$Patchlevel: MiNT library: 25 $

perlglob.ttp:
$Patchlevel: MiNT library: 25 $

> modem?

You can use any modem at all and, unlike Macs, the Atari uses exactly
the same cable as most PCs do.

If you don't have a modem, you might want to keep an eye out for used
2400 baud modems... a lot of people are upgrading to 9600 or 14.4k baud
modems, and dumping their 2400s cheaply... $50-$75 is the asking price
I've seen.

RS-232C cables are usually ~$8 I think.

> protocol, etc. IMO, STalker is much worse than either Flash 1.6 or Uniterm.
> Anyway, it's almost meaningless to sum up a term program in one word
> like "better" than another term program.

Well, I guess I'm either blind (hmm, no, I can see what I'm typing), or
an a**hole (that one's open to debate... in a couple of threads here...
;-).

Alan Page (you know, the _author_ of Flash? The guy writing THE STORM
right now?) says Flash stinks... he wrote it while learning C.

Then again, it all boils down to what you _use_ your term program form.
When I want to download or upload while reading my news, I use STalker
as an ACC... background zmodem is so nice. Then I load up GUS and read
news. When I want to use funky vt-200 (like emacs or vi) on a unix
machine, I whip up Uniterm... It's also faster than STalker.

From the accounts of my friends with faster modems, STalker isn't too
fun to use at high speeds. Neither is Flash. So they wrote their own
ANSI terminal program, TAZ. It can handle transmission speeds higher
than the ST can handle. Being based on DOS's Telix terminal program,
it's a bit light on features, but...

IMHO, calling someone an a**hole because he doesn't like your favourite
terminal program (have you even USED other ones?) is a bit silly...

dmb@case.ai.mit.edu (David Baggett) writes:
: [...]
: It's just MS-DOS, I imagine, but it's still an IBM-distributed CLI for
: PC's. If Atari bundled a copy of Gulam with every ST it would be the
: same thing. They don't do that, and therefore there's no official,
: Atari-sanctioned standard CLI that you can always assume people will
: have.

I'm not trying to start (or participate in) a flame-war, but I wanted
to point out that the fact that PCs in the 90's still boot up with a
CLI as standard, while every home-computer (STs, Amigas) has a nice
Shell with GUI as standard is very strange to say the least... From
what I know, most PC 'beginners' have troubles with MS-DOS, and it
takes them some time to even find out how to use "DIR". On STs, noone
has such problems, because it's *much* more user-friendly to simply
move files around with the mouse pointer etc. As long as 'Windows'
still is a 'shell' which has to be loaded separately (on most PCs
it doesn't auto-boot) the PC's user-friendliness is definetely NOT
up to the ST's... (I could argue with you people about Windows too,
but I haven't got the patience, IMHO, it sucks)
Of course you may say that all *ix boxes come with CLIs, but don't
forget that 1) they're MUCH MUCH MUCH more powerful than MS-DOS
(ever tried 'copy A*.DOC B.TXT d:\' etc.?) and 2) *ix boxes are OLD,
and are supposed to be usable without 14" SVGA monitors (in other words,
with ascii-terminals). Here at our university, the "real" *ix boxes
have X etc. installed of course...
So, while some people might need CLIs (I do, when I run MiNT),
NOONE needs the Messy-DOS CLI (IMHO).

>LineA? I doubt it, since compatibility would drop to about 10% !!

As I understand it, LineA is "officially" undocumented. However, to maintain compatibility, LineA works on the TT (and probably the Falcon too) but *only in ST screen modes*. LineA just isn't there for the new TT modes -- I guess it'll be the same for the Falcon.

I expect someone will correct me if I'm wrong, and could any of the few with Falcons verify the above?

You've summed things up pretty nicely John. Maybe Steve should add this
to the FAQ under "Current Atari Advocacy Flamewars" or something...

> I guess what I don't understand is what are you guys arguing about?
> It seems like one side is saying:
> "The Falcon is not powerful enough for the price for general purpose
> computing."
>
> and the other side is saying:
>
> "But the DSP makes it price competitive in that a similarly equipped
> PC clone is more expensive."

A lot of the "cheerleader"-types seem to think that because their Atari
was great in the past, it still serves all their needs today. Now, this
may be true for _them_, but it's not necessarily true for everyone who
needs to use a computer (and trust me, if you took away my hardware, I'd
be hard-pressed to get _anything_ done).

IMHO, the DSP makes the Falcon the perfect machine for direct-to-disk
recording, and the built-in MIDI ports (as well as excellent MIDI
software base) strengthen this music orientation.

IMHO, the 16Mhz 68030, the 16-bit bus, and the performance penalty you
pay when increasing your graphics mode make it less-than-perfect (though
still usable; the ST is still usable) for general purpose computing...
you know, all that word processing, programming, telecommunications,
UUCP, DTP, etc.

I need a better general purpose computer, since I've only used the MIDI
ports on my ST about three times. My sin was asking for people's
opinions about other systems, and how they felt about moving from their
STs to those other systems.

Source record: 212092

Having read all the ballyhoo about compatibility problems, graphics etc. etc. ad infinitum there is still one over riding fact to take into account when comparing the two formats..

Cost.

To get the same performance out of a PC as you can out of the Atari Falcon you would have to spend at least four times as much money.

That is a fact! Not a fantasy.

This is an important factor when you take into account the current state of the economy and the fact that the public automatically look at their wallets before comparing performance. (See the rise is Lada and Skoda sales..)

Why can't everyone just accept that most computers are great at certain things and crap at others...Atari's and PC's included.

Fuel to the fire..?

Comments welcomed.

Craig

> You see David people buy a computer for a reason and it is kinda
> like buying a car. Just because you have a flat tyre and the price
> of rubber has gone up do not lumber all of us with Wooden Wheels
> and a wooden engin, that wooden go.

This car analogy is starting to wear thin... It's been lurching around on GEnie for weeks.

You buy a car because you have to get places. You buy a computer to get work done or to play games.

You buy a nice, flashy car to impress your friends. You buy a nice, fast computer to get your work done faster.

When you buy a car, you _know_ you're going to have to get it serviced at some point. You _know_ you're going to have to buy new windshield wipers, new filters, new belts.

A computer isn't some sort of magic box... it's a machine that you _know_ you're going to have to service. You _know_ you're going to have to feed it floppies, possibly RAM, possibly hard disk space. You _know_ you're going to want to buy new software for it.

Now, today, in _today's_ market, would you buy an Edsel? No way! You couldn't get parts for it, you couldn't get service for it, unless it's sufficiently like other "real" cars that a mechanic can make a half-a**ed attempt to figure it out for you.

Today, in _today's_ market (not the 1985 market, in which Atari had the best "bang for the buck", had a future, had software, had a market), there's no way I'd tell someone to buy an Atari computer. You can't get parts, you can't get upgrades, you can't get software. If you bought a Mac or a PC, you could get parts, upgrades, software to your heart's content. If you bought a PC, and decided it wasn't fast enough, you could probably pull out the CPU, and stick in one of those silly clock-doubled chips. _Today_, almost all motherboards (with the exception of Atari motherboards) have socketed CPUs, SIMM slots, expansion slots, etc.

Atari took a great computer, a great market position, and seriously messed it up. Since I bought an Atari computer, this makes me mad, since _I'd_ probably be more productive with my ST if they hadn't. I wouldn't've had to pay $500 to upgrade it from 1M to 2.5M two years ago.

Atari would be foolish to do anything but give away MultiTOS at this
point. If they really want people to write software that works well in
MTOS, they need to get it on _all_ the machines. Why is the Apple
software so compatible? Apple set some ground rules, then gave away all
OS upgrades for years. Users upgraded, and the progs that didn't follow
the rules broke. Enough free upgrades of the OS and voila! The only
programs remaining are highly compatible. C'mon Atari. Do the wise
thing. Help your users, don't milk them. They're the best resource you
have at this point.

>calls, no?

Actually, the STOS incompatibility comes from a routine used to control the mouse cursor. Instead of doing it properly, and writing their own mouse packet interrupt handler, they use an undocumented location to hack into the standard mouse handler function.

The STOS "fix" for each new TOS version is to find out where the routine has moved to for that particular ROM, and add some kludge code so that STOS can recognise the ROM and use the new address.

>Face it, the OS does not have adequate graphics functions! You

>there are still some things that can be done with the ST hardware and
>it's up to the game developers to catch up.

I think we all know that you have to write your own sprite routines etc. It is possible, however, to make these routines work on new machines. Maybe not in new screen modes, but certainly still work in the ST screen modes.

>Yeah.. By not releasing 68020/68030 machines until recently, eh? Well, I'll
>tell you that it's common knowledge the mistakes that Atari has made in
>the original ST computers that has made it compatability difficult.
>Remember who wrote TOS 1.0?

Digital Research, for the most part. An extremely quick and nasty port of what was to become DRDOS on the PC. However, Atari had to get the machine to market as quickly as possible. That's not to excuse them, but it does explain the background.

Yes, there were mistakes, and they make compatibility difficult. However, things have got a lot better of late.

What annoys me is when Atari say "Don't do this" and some games or demo programmer decides (somewhat arrogantly, IMHO) they'll do it anyway. The STOS hack falls into this category.

I also get tired of the excuse "Atari never said we couldn't do X" -- compliance to programming rules is in the spirit, as well as the letter, of those rules.

Where does it say that if you have a PC you have to pirate anything?

Personally, I want (very much!) to have the fastest computer with the best graphics for my money. If I wanted the best, fastest computer with the best graphics, I'd buy a Silicon Graphics workstation. I don't happen to have $14k in my budget for a computer.

Atari's Falcon (or Fall-Con as was suggested by a fellow Atari user on GEnie) is a neat machine. It's got nice low-res graphics, and some nice high-res graphics. It's got _fantastic_ sound. However, it's priced _exactly_the_same_ as a Mac LC II, which has some advantages. It's also priced _exactly_the_same_ as a _complete_ '486 system, capable of 1024x768x256 graphics, and able to run any one of three or four multitasking operating systems (at least two of which, OS/2 and unix, are preemptive multitasking, multithreaded operating systems).

People are going to look at a Falcon and say, "Wow, neat." Then they're going to buy a PC because it's faster. Even if they don't need the speed.

Hi, thanx for the info. However I can teel you that a friend of mine who
has 3.15
has it running on his 1040 ST upgraded to 2 megRam and TOS2.06. I am
still waiting
for delivery of the upgrade to 3.15.

Maybe this needs a different thread but has anyone else experienced
arrange mode
data corruption, especially when recording in arrange mode while in MIDI
synch mode...?
I am getting somewhat bored with having to load arrange after a few
takes...

848. Can I run an ST or a Falcon as X-terminal?

Newsgroup: comp.sys.atari.st
Date: 1993-01-14 17:41:25 UTC
From: cjp@aber.ac.uk
Message-ID: <CJP.93Jan14174125@deca.aber.ac.uk>
Source record: 212093

I'm sure that this should be in the FAQS, but I wasn't really
interested until they took the SPARC ELC off my desk.

I'm back to Uniterm on my ST - very nice but not the same.

I could probably obtain the cash for a Falcon if the technology
existed to make it into an intelligent X-terminal. Anybody know about
Falcons and Ethernet cards and X-server software.

Alternatively, I could do the same for this well-used, well-loved ST,
so please tell me about that too in case the Falcon solution does not
exist yet.

Thank you all.

I'm thinking about picking up an old 520ST, but it's dead. I tried calling B&C computervisions last night, but they have gone out of business (or relocated or something... never thought that would happen) So here I am with a potential fixer-up on my hands, and no idea where I can get the parts.

It makes 8 bombs at powerup... I've never used an ST before, so I have no clue what that means... any help would be appreciated

-Jeff

| can even use keyboard control.
|
Oh well, I guess I'll have to keep my ST going even if I buy a Falcon then.
Alternatively, I could just junk the ST and get a PC (far more likely).

Has anyone used the feature-packed "REDACTEUR" word processor? I have Word Writer ST (and am very happy with it, but it looks prety dated and many features are becoming annoying). Redacteur looks a lot like WWST, has anyone switched up to Redacteur FROM Word Writer? Are they similar? Any help is appreciated. Oh, also! The manual is HUGE, but is it well written...size isn't everything...well I HEARD that anyway :^) Well, i've never PERSONALLY heard that :^) :^)

>Erm... What exactly does AIM do? I know it's graphical manipulation,
>but that doesn't say much. What uses does it have? Can it enhance
>images? Reduce blurring? How "smart" is it? How fast? Will it run
>in mono? Is it still available? Hope these aren't too many questions,
>answer any of them you know. TIA,
>

OK, one at a time (no pushing please)

1) AIM was developed by a Dutch university for manipulating digitised images, basically covering the early stages of image processing - feature enhancement, edge detection, filtering, that sort of thing. It was released as PD with the intention of getting people interested in the field.

2) It's main `use' is just for experimenting and learnign about what digital image manipulation techniques can do - as would be used for enhancing satellite pictures, and in the initial stages of machine vision (object recognition etc.)

3) It can improve particular aspects of a picture by reducing noise, expanding information within a greyscale range, thinning lines, tracing object perimeters and so on (hard to describe really - you had to be there !). The results can be very impressive - readable text appearing from splodges, for example.

4) It's smart in the sense that it suggests parameter values, but manipulating images effectively is an art.

5) It's `fast enough' (pretty good considering what it has to do) , but works on fairly small images.

6) Works beautifully in Mono - the interface is one of the best bits - a cshell like command line or GEM menus, and 4 image windows.

7) It's PD so should be generally available (try hensa.micros in the UK).

Hope that answers all your questions - hang on, it was _me_ that was supposed to be getting information out of this. _Hopefully_ a detailed article on it will be appearing in ST Applications soon ;-)

Sam

NONE of the above. In fact, the company also sells MAC's which happen to
COST more, which, btw, increases their profit margin.
The thing is, the only competition in the music field for the Atari is the
Mac, which is inferior...(their sequencers suck - I have used them)
So the next time you want to jam your foot in your mouth without asking for
INFO......DON'T!

Physbase() and Logbase() are only supported for standard ST resolutions.
Such a method could and will break on third-party graphics cards.

The custom assembly routine could, however, write to a buffer in
GEM standard format and then blit that buffer to the screen.

Everyone my ass!! You mean to tell me "everyone" has a 24bit XGA card??? Thats
what I meant as a good graphics card. The SVGA which is standard on IBM's is
not an "incredible graphics card". Even the Falcon has better colour, and
almost the same rez!

> screen resolution handle several windows on the screen at once?
>
> Craig.

Its too bad that you're ignoring the Falcon's capabilities but let me ask
you this...(I'm assuming you're assuming that the Falcon's screen rez is not
large enough)...How the hell do you compare something you know about with
something you don't? Windows (I have used it...got rid of it cuz I didn't like
it) usually runs at 640X480 mode with 256 colours, right? (I'm sure you could
expand this, but most don't as it eats too much memory...) Anyway the Falcon
could amply support this rez...It goes up to 7 hundred something by 4 hundred
something, so what's the problem?
If you're NOT comparing to the Falcon, surely you know that the ST is not
multitaskable ('cept with Mint) so there goes your example...

That's a very interesting statement you make backed up by no facts whatsoever.
This was true in 1985/6. This is most definitely NOT true now, nor has it
been for years. Let me surmise what you're saying: a 386sx at 16MHz with a
super-VGA card, a 65MB hard drive, 4MB of memory, and a DSP board costs -
$6000????

>to 15 frames/sec or more) so that it appears continuous.

I don't really have time to try anything specific. But I do know that the VDI blit function just calls the line A blit, so blitting a screen image should take almost the same time (there would be a small setup penalty for the VDI, but that would be insignificant compared to the cost of blitting a screen image). I presume that you're using vro_cpyfm? Also, did you remember that for screen blits you should put a NULL address in for the bitplane address? (I think this is faster, it means the VDI can just grab its internal screen info instead of having to use whatever your provide.)

>super-VGA card, a 65MB hard drive, 4MB of memory, and a DSP board costs -
>$6000????
>
{Shtuff gone!}

HUH? A 386-16??? You must be joking!! At least a 486dx-33 is needed!! (Ever use real-time sampling/playback? 386-16? pshaw!) Oh and how about the incredible sampler BUILT-IN to the Falcon? You'd need an incredible sound card to have 16bit sound and 8 channels (4 stereo channels) with sampling/playback with digital distortion fx...(don't think there's one that EXISTS). In fact, the Falcon sampler is better than a lot of commercial DEDICATED samplers!
How about the midi capabilities??

I admit four times the price is a bit much, but twice as much is much more like it.

Oh yeah, you can't just call a 68030-16 a 386-16! In fact, its ludicrous to compare the Motorola with the Intel using MHz units. (re: the big flamewar a little while back..if you really want to know the reasons)

AcEzE.

867. Re: Amobea HAM 4096 into STE 4096?

Newsgroup: comp.sys.atari.st
Date: 1993-01-14 20:24:02 UTC
From: wells_s@kosmos.wcc.govt.nz
Message-ID: <1j4i52INNrth@golem.wcc.govt.nz>
Source record: 212028

Amiga IFF pictures can be converted into Spectrum 4096 color pictures
using Photochrome 3.0 (It will only handle up to 320*200 pictures
though). This does a pretty good job!

To stop 'phantom dots' from appearing in your Spectrum pictures, make
sure you have turned your computer off for at least 5 seconds before
running Spectrum 512, as it pulls a lot of tricks which require the
video shifter chip to be in-sync (cooled down etc...)

Spectrum is supposed to support the 4096 color palette of the STE,
but I'm not sure which version, or if in fact, it does support it, as
I only have an STFM, so can't test things too well!

>Dom De Vitto

Pic-Switch has it's advantages, but only supports 16-color formats, these days, that's not enough 8-)

A combination of 89A-87A version 1.1 and Photochrome 3.0 will convert virtually any GIF in existance to either Spectrum 512 (in 512 or 4096 colors), or to one of it's own formats (showing over 10000 colorso on the STE). To my knowledge, it doesn't support JPEG, but I might be wrong. There is a un-JPEG utility for the ST probably on atari.archive.umich.edu

Photochrome 3.0 is also available on the above site.

Also, you might want to try View-GIF (1.2 I think). Which will load in several foreign formats, and convert them into various ST formats (or into other, or the same foreign formats, such as GIF, IFF, MAC etc.)

Does anyone know whether Genesis 2 was ever released?!

Genesis was a land-scape fractal generator. Version 2 is supposedly
a planet fractal generator. It was a very fast program, which turned
out pretty good results! If a new version is available, does anyone
know where I can find a copy!?

Also, is there a PD/Shareware utility available that will let me view
Prism-Paint (.PNT) files on my STFM!? (Art-Gallery has the option,
but refuses to load in even 320*200*16 Prism paint files!)

Also, there is a rumour that on a recent Genie RTC, Bob Brodie is pushing
to get Multi-TOS released as PD software. This would really put Atari
on the map! Free multi-tasking software, which does what
MS (Mega Slow) Windoze doze, except faster. (Doesn't look as pretty,
but that's one of the reasons windoze is so slow.)

Thanks in advance....

Say bye-bye Atari!

If Amoeba does this, it will practically kill all the advantages the Falcon
has. (Apart from MIDI). No doubt the Amoeba's version will be slower,
and more graphics+sound oriented. (The thing *is* used 90% as a games
machine purely.)

What is this '3do' thing. And the Amiga AGA. (Advanced Games Adaptor!?)

The arguement of 'you can run the same on a harddrive less ST as you can on a harddriveless IBM compat' is garbage. I'd like to see any person trying to run 30meg+ games from floppy!

Most IBM Compat' games these days are in excess of 10meg. (Due to sod all data optimising due to the 'they all have hard drives, why bother' routine.) Windows won't work without a Hard-Drive, the ST has an almost equivalent built in! (No multi-tasking, and not as pretty, but similar principle).

If an IBM doesn't have a Hard-drive, it's practically useless. I have been using my ST for 5 years without a hard-drive, and apart from extracting 900k archives, I have had no trouble at all! (900k just requires a bit of disk-swapping.)

At least I can access all of my RAM without the need of RAM recogniser cards etc - Shadow RAM!? Talk about primitive!

Small coming on ..
>
>I have no problems in mounting a Mac formatted SyQuest cartridge under
>Spectre (connected to ACSI, of course). A normal hard disk drive should
>work the same way.
Normal hard drives do indeed work the same way. I have connected 600 meg
optical drives (removable) to spectre after formatting on a mac and they
work fine as well. SCSI tapes don't show up however. Boo hoo.

I tried the trick with formatting a 720k MFM mac disk under apple file
exchange. It works beautifully with both a superdrive equipped mac and my
spectre. Very neat indeed. this should work without the spectre128 as
well, unless the spectre software does not identify the drive as using a
SWIM controller, as it does in GCR mode.

>machines, percentagewise. There is a tacit claim in your post that

And what proof do you have of this assumption? This is YOUR argument
working against you.

>your best guess about the situation (with no data) is better than
>mine. Why do you think you know so much more?

Twisting words are we? How about this? I never had this intention. Maybe
I stated it wrong...here it is again...
I'll even redefine it precisely...
"IMHO, the reputation of the IBM platform being a piracy rampant platform
has led me to believe that the level of piracy there (the IBM platform) is
much higher than the level of piracy in the Atari platform." (see final sttmnt)
Reputation is not dependent on proof, but rather is an independent property
derived from personal experience.

>(if they exist), we will never really know how much piracy goes on.

True, but why is this the case? I submit MY opinion as to why this is the
case: Piracy, in the IBM market, has grown to big to be controlled.
[stuff]
>force my belief on you -- YOU claim that my guess MUST be wrong. I
>claim that I have no idea, but that I don't think you should go around
>tacitly assuming you're right about the piracy issue without having any
>facts to support your belief.

Not true. As a forum to air OPINIONS, I have all the right to air my
opinions in the usenet, as do you, yours. After all, isn't the general
sentiment that Atari Corp. is mishandling their business an OPINION?O
And I never tried to FORCE anyone to worship my beliefs, after all this
thread was originally mine... It is totally up to you whether you want to
believe what I say or not. In your case, your assumption forces you to
challenge mine, where I have responded with MY reasoning.

>You're missing the point that I have no reson to prove anything to you,
>because I'm not asserting that I'm JUST ABSOLUTELY CORRECT on the
>issue. I'm saying I *don't know*, though I do have a "feeling," which,

>again, I wouldn't use in (say) an argument against Atari's or Atari
>owners because I have no facts to verify my *feeling* with. YOU, on
>the other hand, DO have a burden of proof here, because you are
>asserting that PC piracy is much worse than ST piracy. I'm saying "you
>shouldn't use that as an argument because you don't know for sure."
>You're saying, "I'm right, and even though I can't substantiate it in
>any tangible way, I'm going to continue using it as an argument against
>PC's, PC owners, etc."

Nope. Not even close. Sorry if I have mislead you, but your assumptions
of what I am saying is merely an act of putting words in mouth. Let us
assume that 1% of IBM platformers pirate software. Even this amount would
substantiate my claim that pirate more than Atari users. And, yes
I have the option (AND the right) to use this as an argument, as it is a
REASONABLE assumption that at least 1% of a software market pirates.

>>The point is, I don't need to PROVE it to you. You can PROVE it to yourself.
>
>I CAN, yes, but I have no burden of proof, whereas you do. I don't
>have to PROVE anything when I assert that you shouldn't argue on the
>basis of no real information. Your job is harder.
[stuff]
>that way; I only wanted to make clear that I thought you were dodging
>the real issue, which is FACT vs. OPINION.

It was YOUR request that I PROVE my OPINION, therefore what is your point?
I wasn't dodging the issue, you're misinterpreting it. Fact vs. opinion?
In this case, my opinion is a fact using my reasoning above. (the 1% business)

This is my last posting on this subject. I don't see the point in renewing
this thread, as it serves no purpose. People have their own conceived
notions, and I'm sure you'll find that in this case, mine is true.
Final Statement:
My position on this whole subject is :
The *MAGNITUDE* of piracy on the IBM platform far exceeds that of the
MAGNITUDE of piracy on the ATARI platform.
Nothing you, or anyone else, say will make me change my mind.
This has already wasted enough time...

AcEzE.

>To answer your serious question here, yes I will buy the Falcon, as I
>think it is the only machine which has got its act together.
>Reasons:
>1. It uses Motorola chips and not the Intel Chips (designed by idiots).

Perhaps the original design was not optimal, but I believe that even the
Intel competitors would call Intel people idiots. The I860 RISC chip
is quite a nice chip and has more in common with a Motorola Chip than
and 80386 chip. I believe that Intel would drop the design restrictions
from the early 8088 chips if it wouldn't cause so many problems with the
compatibility with existing programs.

>4. I am sick of using PC's, which is a standard here at my workplace. I
>have done installations of S/W and H/W on about thirty PC`s and I must
>say it needs a hell of a lot of knowledge about the machine before you
>can get all the apps to work correctly with each other.

Many of these problems results from the operating system being much to small.
Each program in DOS needs to create part of an operating system for any
special thing it needs to do. When a user executes many programs on one
machine, the programs fight for memory locations for their special routines.
Since DOS is so small and has a limited operating system definition, each
program becomes huge and conflicts with other huge programs.

> What bugs me most about these stupid machines, is the memory layout. 'Normal
> memory`, High Memory`, Extended, Expanded, and for the last three you always
> need special drivers, which eat into your idiot 640k memory.

These restrictions exist because DOS is too small and too limited. It didn't
have a clean design at the start (it was trying to clone CP/M and get away
with copyright problems), and then bandaged every time programs needed a
new operating system feature.

> I prefer having the OS in ROM, and having the full RAM available for
>Apps, not having to install all kinds of crap to get the system running
>and eating up my memory.

TOS and GEM eat up about 200K of RAM. This is more than a standard DOS
machine. But after you load many DOS memory managers, TSRs, and fancy
device drivers, DOS may be using more memory than TOS and GEM.

Even though TOS and GEM are in ROM they still take up address space. And
that address space is the same address space that RAM uses.

>5. The windowing systems in use today on PC`s is no more sophisticated
>than GEM, in fact I prefer GEM, at least I know where to find things.
>Windows needs all kinds of setup specials like Pif files. The file manager

>in Windows is crap, try copying a file from one directory to another.

The file manager does some things that GEM doesn't do, but you are right in that is sure isn't intuitive. I spent 5 minutes learning GEM and days learning M/S Windows.

> OS/2 is another one of these badly written OS`s with a level of complexity
> which puts even Messy-Dos and Messy-Windows to shame.

I have found OS/2 to be the best operating system for microcomputers. It finally is big enough to have the major operating system concerns defined. No need for lots of bandages. It is consistent in its user interface, like GEM is consistent. OS/2 gives the user full access to all available memory, like TOS does.

It does have a higher level of complexity, but it also does more than the other operating systems do. It does full multi-tasking. For a stock broker, banker, and scientist, full multi-tasking comes in very handy. Also, OS/2 has a clean networking interface. The only time there is problems is when you want to run a DOS networking facility. The DOS software doesn't share and assumes that it can have whatever hardware it wants whenever it wants it. That is where the OS/2 headache comes in. People try to run M/S windows programs and DOS networking programs on OS/2 and they just don't work well in the OS/2 environment. However, with the several hundreds of thousands of copies that OS/2 has sold and the development interest, I believe that the OS/2 software market next Christmas will be like the M/S Windows market was this Christmas.

>7. Apps written for ST's usually cater for people with minimal machines,
>on PC`s the programs you get nowadays assume you have at least umpteen
>Megs of memory and consequently need a fast processor. (Why can`t people
>write small and fast apps anymore? I had some beautiful S/W running on
>my 48K Spectrum!)
My 48K (actually 72K is you count the ROM (in fact the 24K in RAM gets copied into RAM leaving around 28K free after booting)) Timex/Sinclair 2068 (US equivalent to Sincliar Spectrum) con't come close to running the software needs I have on my Atari ST. A minimal machine provides minimal features. Now the catch is that many people only need minimal features. And it is rediculous to pay a large some of money for something a person uses for minial features.

The cost of the CPU is coming down. I think I can buy a M68000 for the price of a sandwhich. At that cost, I can afford to use a M68000 for a printer controller instead of designing my own expensive logic. So some of the waste in memory and CPUs come for the smaller design effort and cost of building an efficient system when a sloppy system costs less to make.

Automobiles have the same phenonminon. I think that auto designers are arrogant, stupid theives. All of the garbage on my 1986 station wagon is complex, expensive, and useless. My brother-in-laws 1960 Ford is simple, inexpensive and very easy to fix. It is also very loud, uncomfortable, and ugly. This paragraph is meant to be biggoted.

My point is that every machine has a purpose. You need to get the machine that fits your purpose. A person is unwise to call a machine designer an idiot based on the fact that the machine doesn't fit the users need perfectly. A user should view the market and find the machine that best fits his or her need. Also, critics should look into the design aspect before complaining. Usually a perfectly designed machine is unaffordable. The affordable machines don't do exactly was the user wants, but it does enough right to make the user tolerate it at a cost he or she can afford.

>I could go on and on with this, but will leave it for now. Hope it helps.

Excellent points. I agree with you on nearly every point. I had to play devil-advocate to bring out some points that I believe should not be ignored.
>
>
>Wim Vleeshhouwer
>European Space Agency
>Noordwijk
>Netherlands

Ah, You're not from America.
You're forgetting our American philosophy. "Newer means better. Changed means better. Bigger means execellent. And a sloppy profit is better than an efficient margin." You have to take into consideration that religion, nationality, and race do influence design. This is probably not an American politically correct statement, but it is a point that is evident in the way we Americans have designed things and forced other nations to comply with. You can also see it in our American pride when when make other nations conform to us, but are relectant to comply with other nations standards.

>> way to access them in the future I would be very thankfull.
>>
>Tim, you can subscribe to Z*NET and receive it automatically via email if you
>send a request to stzmagazine-request@virginia.edu .
>
>---

OR you can access the Cleveland Free-Net Atari SIG that usually has
all of the online magazines by Sunday (except for AEO which is posted
a little later).

You can access it by telnet'ing to "freenet-in-a.cwru.edu" or b, c.

There are around 100 people getting their online magazines from this
source, so it is a good place to get recent mags.

And old mags. There are over 300 issues of STR, Z*Net, and AEO stored
on the Cleveland Free-Net.

> Okay, i've seen people stick up for os/2 saying how great it is, but
> then on the other hand, not many people seem to be using it.
> I wonder why?

More people aren't using OS/2 becuase:

a) OS/2 1.x was _terrible_... even worse than Windows 3.0
b) People using DOS aren't aware of the fact that it'll do DOS
better than DOS can; not to mention the added functionality
they'll be getting (multitasking, a GUI, etc).
c) People using DOS/Windows are convinced that, "Oh well, Windows
is pretty sucky, OS/2's probably just as bad. Might as well
stick with what I have now."
d) MS has brainwashed people into thinking Windows is "cool" and
"the way of the future".
e) People are too lazy (and too stupid) to install any software
onto their system, beyond the stuff that came with it in the
first place (betcha there's a million DOS 3.3 users still out
there).
f) They were too intimidated by the installation diskettes...
there's ~29 of them.

> and a little joke i've seen.... OS/2 , 1/2 an operating system?!

That one's older than you are... :-)

>> [i asked eric for advice on making MGIF fully AES/VDI only...]
>I don't really have time to try anything specific. But I do know that
>the VDI blit function just calls the line A blit, so blitting a
>screen image should take almost the same time (there would be a small
>setup penalty for the VDI, but that would be insignificant compared
>to the cost of blitting a screen image). I presume that you're
>using vro_cpyfm? Also, did you remember that for screen blits you
>should put a NULL address in for the bitplane address? (I think this
>is faster, it means the VDI can just grab its internal screen info
>instead of having to use whatever your provide.)

perhaps more detail:

MGIF does the following (all no-no's):

1) use Logbase/Physbase to find screen. lay out 4 other screens
(aligned).
2) "draw" 4 screens in memory with line A putpixel (floyd-steinberg
dithered). this can be replaced with directly twiddling "pixels"
in virtual screens, eliminating line A but it is so simple to
use putpixel. in fact i might have already done this in newer MGIF.
3) in an infinite loop, doe XBIOS Setscreen/Vblank for each of th
four screens. (loop terminates when key pressed, check with BIOS)

the "equivalent" GEM-only version (that i have tried) would be:

1) open a window, workstation
2) "draw" 4 bitmaps in memory (set word bits on/off depending on
pixel value, no OS calls at all)
3) in infinite loop doing some "legal" blit, vro_copyfm or whatever.
(event_mult() tests for exit)

the latter does not run fast enough (ie u can see the frames pass buy
instead of it appearing continuous and hence grayscale-like image).

i agree that VDI blit would run about as fast as line A blit. however, i
am not blitting at all in the first version.

i presume there is no real way to do this fast enough with 8MHz 68000
ST architecture with AES/VDI only. which is probably ok anyway. things may
be different with newer atari models (which i don't have). it is not that
important. move along...

ciao

884. problem with 4 meg expansion on 1040 ste..

Newsgroup: comp.sys.atari.st
Date: 1993-01-14 22:35:11 UTC
From: kort@fwi.uva.nl
Message-ID: <1993Jan14.223511.663@fwi.uva.nl>
Source record: 212100

I recently installed 4 meg in my 1040 ste, and it all works great. But when
I try to open a folder the computer doesn't do anything anymore..
I can't move the mouse, and the screen remains still.
When I start up any program before I open a folder, everything works fine,
so I expect this is a software bug ? If it's a known bug, is there a fix for
it ?
P.S. I've got a: 1040 ste with 4 megabyte and tos 1.6

Message-ID: <1j4qgsINNsrb@golem.wcc.govt.nz>
Source record: 212019

Agree also, Flash is not junk, a little low on features, but simple,
quick, and works fine!

STalker is too expensive. And it's impossible to get 80*24 column screen
out of it, unless you use a small font, which makes things difficult
to read (especially those people whos eyes are half stuffed already).

I mean, the full 80 lines across, 24-lines down being displayed at once
on the screen. These windowed programs don't do this, due to scroll bars,
title bars, and menu bars etc. Bob Brodie might like it, but he's
probably using a TT where he *can* get the full 80*24 on the screen due
to the extra resolution! It does background downloading!? So, it's
not a major extra. You still have to wait for it, and it's slower than
single-tasking downloading.

Uniterm is good, displays what you want, is not expensive (it's free
unless you decide to send some money to the author, but not compulsory)
Has plenty of features (okay, the capture is very awkward to operate,
and it has no text/capture editor built in.... but it works!)

Remember folks, when comparing these programs, that most folks will
be running it on an 8Mhz (or maybe 16Mhz if they're rich 8-) maching,
in 640*200 or 640*400 resolutions! And probably have 2400 baud modems!

Just for the record, how many people out there *do* have 9600bps and
higher modems!?

>What is this '3do' thing. And the Amiga AGA. (Advanced Games Adaptor!?)

I wouldn't say "The thing *is* used 90% as a games machine purely",
I'd rather say that lots of Amigas are bought for games-playing,
BUT a lot of us end up programming, composing etc _AND_ playing
games.

For your information;

AGA = Advanced Graphics Architecture

There's always a way around that. I simply have my F1 key set up to run
XYZ.PRG when pressed. Voila, hotkey external protocols.

Of course, that is not the "designated" purpose of those keys, but since
they're programmable, might as well take advantage of them!

It *would* be a royal pain if this programmability was not there though.
I have tried out term programs that sometimes don't even let you have ANY
access to the file selector, which is also a pain, as UIS III is one
of my most used programs on my system...

>Try using PhotoChrome 3 . This will display GIF , IFF and others in Atari
>SuperHAM mode or PHotoChrome 16,000 color mode. Need a STE to do this.
>

Err, PhotoChrome 3.0 works just great on my 520STFM, I hope you didn't mean
you need an STe to run it. Specifically, using the Super HAM mode I can
get 4096 simultaneous colors on my ST, for viewing GIF pictures at least
(I don't have any .IFF or .RAW or anything so I don't know about the
options for those). It looks really great, I would have never believed it
if I hadn't seen it up close and personal. :)

Now, to get the 32000 simultaneous colors (I believe this is called
PhotoChrome STe mode or something), it is necessary to have an STe.

890. Dead keyboard wanted

Newsgroup: comp.sys.atari.st
Date: 1993-01-14 23:31:16 UTC
From: zimmermk@westford.ccur.com
Message-ID: <1993Jan14.233116.3301@westford.ccur.com>
Source record: 212011
Cross-posted to: rec.music.makers,comp.sys.atari.st,rec.music.synth

Hi.
I'm an EE hacker, and I want to make my own synth. I think I can
handle electrical design, layout, having a PCB made, etc; but I CAN'T cast
plastic, and I wouldn't know how to design the action. So: If you have
a dead keyboard that used to be velocity- and pressure-sensitive, and you
WERE going to junk it, why don't you tell me what it is and how it died?
I can pay about $30 + shipping for the right dead keyboard.
Is this offer unreasonable? Let me know. But I can't offer much
more; if no one likes this deal, I guess I'm just out of luck for now!

Thanks!

Karl

Actually, I agree, I've been using NeoDesk, and I like it, but I have
old TOS 1.2 so I don't really have any features. Does TOS 2.05 work in
a 1040STf? And if so does it come in a 2 chip version, how much?

From: wmagro@uiuc.edu
Message-ID: <C0vBwE.CAB@news.cso.uiuc.edu>
Source record: 212015

I am an ST user. I hate clones in general. Not because I am an atari cheerleader, though. I just don't like the way DOS feels.

I was looking at a DEE ONE ad, and I see that I can get a 386DX-33 with 64k cache for $338. I already have an extra multi-sync monitor and $250 meg drive around, so that would be my total cost. I think for this kind of (almost) pocket change, I can play around with OS/2 and/or Linux.

I certainly expect to upgrade the motherboard to a localbus 486+ withing a year. Other than that, can anyone tell me why this wouldn't be a fun, cheap toy to play around with? Has anyone had bad dealings or bad product from DEE ONE systems?

Thanks.

>an example of being called 'nasty things'?

No, I don't think it was directed at me; it's merely an example of a
mind-numbingly childish, unproductive, and ad hominem comment that came
from one of the unnamed participants in this so-called flame war.
Hmmmm. Let's see.... I believe it was YOU in fact.

Learn to control your temper long enough to read the messages before
you respond to them. I didn't say that those comments were examples of
nasty things said to me; I simply said that people who weren't
mentioned (such as you) have said much worse things, and for that
reason I fail to understand why I was singled out (except for general
character assassination). When all else fails, try to discredit your
opponent, I suppose.

>It APPEARS that you thought the lines were written for you. This might serve as
>an indication of how far out of line your interpretation of postings within
>this newsgroup has gotten. If you got this wrong, how many other postings
>might you be misinterpreting?

I'm not surprised that it not only APPEARS that way to YOU, but that
you are willing to go out on a limb assuming that it's the case. I was
only pointing out that though I was mentioned by name as someone who
was flaming people, I have hardly been one of the major offenders in an
arena where comments about "consenting sexual relations" are tossed
about. When I see comments like that from anyone in any group, I get

very disappointed.

I'm eager to see what bizarre interpretation of *these* words you'll contrive. But by posting this note you have only called further attention to your own inappropriate behavior, so perhaps you'll just do that again. (Has telling me off publicly made you feel good yet? Has the net gain been positive? If not, why don't you stop wasting your time doing it?)

? Shelling out works fine for me. I hit F10 for zmodem download, and
F9 for zmodem upload [including file-selector].

It's a sign of DOSification that you want everything in one program,
rather than the more Unix style of using external programs.

This is correct. I have a Mac formatted Seagate ST-277N (SCSI) that is
switched regularly between a Spectre 128 and a Mac+. Other than having
to disconnect the SCSI-DMA adapter when connecting to the Mac+, it works
perfectly between the 2 systems, showing that a Mac formatted HD is
usable by Spectre. 'Course you have to boot off of floppy...

writes:
>Could you be more specific?
>Tell me how I make the ST market suck, please?

I thought I was being pretty specific, but here's a *really* specific
statement for you:

1. You don't pay for software (because you have no money).
2. ST developers don't make any money selling you software.
3. Consider a market consiting of a million people like you.
4. ST developers have to leave the market.

That's why YOU are part of the problem. This is EXACTLY what the ST
market is like now. How many people here have already said they stick
with their Atari's beause of all the freeware and "shareware" out
there? What does that say about a commercial developer's chances?

>"PC people pay for software in enough numbers..." Could you say 30%
>of the PC user market is onboard because of the fantastic piracy
>network? I'm certain it dwarfs any such network Atari may/may have
>had. Whatever.

You're really piquing my interest here. Why don't you let me in on
your details of the vast pirate empire for the PC? Be sure to
cite figures for the ST market that back up your assertion. I
want BBS numbers too -- maybe I can get some RAD NU WAREZ D00D. :)

>In a couple of years, when I intend on investing in a new system, and
>if I still have InterNet access, I'll let you know what I decide.
>You're probably right that it won't be a 68000 machine. It'll probably
>be along the lines of a 68040 or whatever the price/perfomance ratio
>bears out from the market.

Given this thorougly intelligent closing statement, it's clear that you
have misinterpreted my defense of the PC as an attack on the ST. I
have no problem with the idea that you are happy with your ST (except
to know that you are living with something that is slowing you down).
The point of this all was that RIGHT NOW, IF you were buying a NEW

machine, a clone would be a very intelligent choice, simply on a price/performance basis. If you look at the lingering title of this message, you'll see that it's one Atarian's misguided assertion that "PC's are bad because all the software is really huge." When I pointed out that it's not that simple, you kicked into defensive mode and started telling my why your ST was a wise purchase when you bought it years ago. I have no argument with that. My ST was a wise purchase 7 years ago too. (A clone would have been a wiser one, but I of course had no way of knowing things would work out as they have.)

Hi, I've been hearing about the Falcon for a while on this group,
but I have yet to see anything on it outside this group. Which
magazines would cover Atari products like the Falcon the most?
Have there been magazine ads for the Falcon? I'd like to see one.
In fact, I'd like to see the real thing too.

Thanks....

Hmm...A couple of my friends got switched (by their parents) in the late 80's to clones and they couldn't find anything to T-comm on worth a hill of beans, and I have heard some banter to that end around here. Was Qmodem just not in public circulation? Perhaps my arguement should be refined to public circulation (Freeware/Shareware/Bugware) T-comm packages.

Ahem.... I know I know what I know, and I know I don't know what I don't know. What I know is that I know a little about the clone-realm, and what I know just doesn't impress me enough to make me think that a clone is God's gift to computing -- or even that I should, at this point, direct my energies to find out everything I'd need to know in order to buy one.

>>I call it a disease because of how fast it's spreading, and how little thought

That's my arguement -- a lot of people get pushed into thinking a clone is "the shit" so to speak, and end up buying a lot more shit than they need (waste money) just to run some ultra-rave c00l new thingy called Windows -- which, I repeat, they don't need.

>This sounds like more of an anti-mainstream

We can't. It's impossible to come to an exact end because there is no exact data. Above, I was trying to draw a hypothesis. Read it again, and tell me if you think it sounds like it hangs together. I think it does. Or..I think it would be a hypothesis worth testing if I had the means.

From: ph9991_imm@rivers.acc.uwrf.edu
Message-ID: <1993Jan14.222018.634@rivers>
Source record: 212046

Hi!

I've noticed that some sections of docs for some games mention sprites.
Am I correct in assuming that sprites are moveable object blocks handled
by the computer's hardware and accessed by video chip registers? Does anyone
have information on how to create and manipulate sprites in an ST or STe?
My language of choice right now is LDW Basic v2.0, where would I have to
POKE/PEEK to use sprites on my machine? (Right now, my Basic only allows
graphic manipulation of primatives and raster chunks, which are pretty slow)

Thanks in advance....

$500 is a huge amount of money -- I'm just trying to figure out of it's a good
price for a used SLM804 and what the upside/downside of this laser might be.

Don't be fooled! I live in a (relatively) large city in the summer (Columbus, Ohio) and there isn't an Atari dealer ANYWHERE. To my knowelege (and I would be exstatic if someone would tell me I'm wrong and provide me with an address) the closest dealer is probably Dayton, OH.

Well you don't *really* ride around on a motorcycle -- you're supposed
to be walking. But it goes so fast that you *feel* like you're zooming
around on a motorcycle. (Or a skateboard, at least.)

There's an Ultima Underworld II out now too, from what I gather.

I dunno, but it seems to work OK for a lot of other people who read
this group, judging from the amount of mail I've been getting. :)

>Try to send me something if you have time. Maybe the default in the mail-read
>would work. I mean, if it comes in under that, it should be able to go out
>under the same, right?

Actually one-way-only mail paths aren't all that rare. Except for the
machine that's one hop away from you and one hop away from me, the
route mail takes to and from me may not have any hosts in common. So
something could be brain-damaged along the path from you to me but not
vice versa. This used to be more of a problem 5 years ago, when many
of the mail servers were very old and underpowered machines. (No, I'm
not going to say they were all replaced with 486 machines and get
vegetables thrown at me, because I have no idea what's out there
passing the bytes around now.)

Did you all see the 1/93 issue of Keyboard magazine? Geoffry Ryle devotes the entire "Computers On-Line" column (over a page) to the Falcon030. That's very good exposure if you ask me. Pick up the issue (it's the one with Bart Simpson on the cover). Theres also a good interview with Tommy Barberella, Prince's new Keyboardist.

Has anyone out there with a falcon managed to run Spectre 3.0 on it yet?

Scott

Just got my Feb. issuse of Byte.
On P. 58 there is an one page first impression of the Falcon by Tom R. Halfhill
Titiled "Atari's Falcon030 leads the pack". The report sounds favoriable and
pointed out the Falcon use 56001 besides 030 and price started at $799.

So check it out in Byte magazine Feb. 93 issuse p.58.

Yes, the original basis for "DOS" is from MicroSoft.. but I
also understand IBM has the rights to modify it for the "PC-DOS"
they ship with their machines.. there used to be some
incompatibilities because of that.

But I think the point is that IBM *does* provide a CLI based
OS with their products, no matter who it is who originally
programmed it, which invalidates Warwick's argument...

>>Dave's point is that an ST, as it comes out of the box has *no* CLI
>This is true. Out of curiosity, though, does the Mac come with a CLI?

I don't believe it does.. but then again, as I've said before,
I don't know much about Macs...

All well and good, but with an 8-pin differential there aren't any pins left over for RTS/CTS flow control, to say nothing of other goodies like Ring Indicate and such. Just another of the trivial little details that bug the hell out of me (must've been Steve Jobs' idea, it's also carried on in the NeXT machine...).

>the box" has *no* CLI at all either. Does this make the Macintosh an inferi
>computer?

Good question... somehow it seems that all this argument has
lost its point... I don't even *like* CLIs..!

I *think* I remember seeing a CLI Accessory for Macs, and I know
they're available for the ST.. and Windowing GUIs are available
on the PC for anyone who likes that kind of interface..

So everyone should be able to have the kind of interface they
want, no matter what computer they have..

Maybe that's what the point should be...

>were problems with the keyboard but I am using a different keyboard/
>machine now.

Kind of a bug in the keyboard mechanism. If you have not completely released one key before going to press the next, you get the keycode for a different key. So if you had typed S and reached for the D, you get the F1 key if the S was still down when you hit D. This happens to me a lot when I'm typing fast.

Actually, as it was explained to me, if you have any 3 keys pressed down, and you examine the parallelogram that is described by those 3 points and a 4th point, you'll see that the actual keycode you get is that of the 4th key. So, the reason you have this problem with S and D is because you also have the shift key pressed at the same time...

AL RASHID SHAHIR writes:

>My position on this whole subject is :
>The *MAGNITUDE* of piracy on the IBM platform far exceeds that of the
>*MAGNITUDE* of piracy on the ATARI platform.

This is probably quite true.. the absolute numbers of "pirates"
in the IBM market no doubt far exceeds (by orders of magnitude)
the absolute numbers of "pirates" in the Atari market.

While it may be a sad commentary on our society as a whole, you
can actually track the popularity of a computer platform by the
activity of "software pirates".

When I was writing software for the Ohio Scientific line of
computers, back at the dawn of the microcomputer revolution,
I used to find my games were easily available.. (this was before
the phenomenom of BBSs had even been conceived). I was offered
"pirated" copies of my own games several times...

OSI had problems though.. they had a terrific computer, but the
company didn't know what to do with it, or how to market it..
(deja vu, eh..?)

This was just at the time those two "wonder boys" out in
Cupertino, California were starting to crank out the Apple 1 from
their garage... if the OSI management had had any brains, we
might not even know the name "Apple" now...

But they blew it.. they didn't upgrade their machines when the
competition started passing them by, and they couldn't seem to
figure out how to get the news of their teriffic computers out
to the buying public.. so one of the best computer designs I've
ever seen faded away, never to be seen again.
(and you wonder why I'm so disapointed in Atari..?)

The most telling thing about their failure though was the fact
that OSI software was barely being pirated any more... no one
cared to copy anything for a dead computer.

The Atari 800 was a terrific computer... and there was some
pretty terrific software for it... and there were incredible
numbers of pirates copying it all... but the computer died,
and the pirates moved on to the Commodore 64..

Once the C64 began to die, the pirates stopped copying *it's*
software, because by then the Atari ST and Amiga had hit the

scene, and they had software that was *really* worth copying..

I'm not all that familiar with the Amiga market, but from friends
who are, I understand there was as much of a problem with piracy
as there was with the ST..

Well guess what, folks.. the pirates have moved on again..
the ST is dead, and one of the more telling signs is that the
pirates ignore it now...

Of course they've moved on to the PC... that's where all the
action is... that's where all the new software is being written..
that's where the software that is worth copying is...

Anyone who tries to make the point that piracy is more rampant
on the PC platform is just reinforcing the argument that the ST
is dead.. that there is no longer anything worth copying on
it, and that there are so few users left that no one cares to
copy anything.

It's too bad, and pretty sad, but that's the facts of life...

Just to yank the ST cheerleaders chains a little, tonight I upgraded two IBM PS/2 Model 70 computers by adding 80387 Math Coprocessors to them.

The upgrade took probably five minutes each.. open the case (no tools needed at all), pop out the floppy drive and hard drive (both DESIGNED to be easily removable), pull the pop-fasteners to take out the drive sub-chassis, then simply insert the coprocessor chip into the socket that was already PROVIDED.. put it all back together easily and run AUTOCONFIG...

All of a sudden the machines were turbocharged.. FRACTINT (fractal generating program) ran like greased lightning...

So.. tell me how you add a Math CoProcessor to *your* ST...????

(God, those PCs are *so clunky*... everyone KNOWS that..!)

Golly.. that sure was an informative and fact filled response..

>So the next time you want to jam your foot in your mouth without asking for
>INFO......DON'T!

You still haven;t told me why that particular retailer would suddenly
wake up one morning and decide to become "anti-Atari"..

Isn't that "asking for INFO"...?

Or do you have an "Atari Cheerleader" definition for it..?

The Mac sequencers suck.. OK.. does that make the dealer "Anti-Atari"..?

Wait.. let me go back to my original question... maybe you can read it
again, and this time find some kind of factual answer...

>
>Well, ok.. assumming that's true.. WHY would a retailer whose livelihood
>depends on selling products from various manufacturers be "anti" ANYTHING???

If that's too hard a concept to understand, maybe I can try to simplify it..

The extra TT/MegaSTe serial ports, and the one on the Falcon, are all capable
of something like 156Kbaud (that's 156,000 baud), anyone with the exact number
feel free to post it... In addition, the Falcon030 serial port can handle
up to ~800Kbaud with an external clock signal. Ooooh, that sounds like fun. :)
Makes it about 10 times faster than a floppy drive!

Using the Line-A is OK providing you bear in mind that it will not support
any new resolutions. Atari have left it in all versions of the ROM for the
purpose of compatibility. Some of the locations will still be supported
in the new resolutions because they are invaluable. Atari did ask developers
what they thought should remain supported but we never got any feedback as to
their decisions so we don't know which ones.

932. Floptical Woes

Newsgroup: comp.sys.atari.st
Date: 1993-01-15 10:21:29 UTC
From: ralph@laas.fr
Message-ID: <RALPH.93Jan15112129@cubitus.laas.fr>
Source record: 211970
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

My Floptical drive has problems which I believe might be of a hardware origin. Mine is a Freedom Floptical Drive, and it's back panel gets hot as someone else posted in either ZNet or AEO. It is connected through an ICD AdSCSI card to my Mega 4 ST running TOS 1.2. I use ICDBoot 6.01. The particularity of my installation is that the AdSCSI card gets its 5V from the Floptical drive. Rather than use the 1.4 amp 9V power supply that came with it, I use a 2 amp 9V power supply.

When the drive is empty, ICDBoot sees the drive and says it's an INSITE drive. When I place a diskette in the drive, the light comes on as it tries to find out (my conjecture) what kind of diskette it has. With any diskettes, 720k formatted ones or 21m unformatted ones, this sensing operation loops and the drive makes a light clunking sound at 2 second intervals. During this state it must be sending a busy signal back to the AdSCSI adaptor since neither ICDBoot nor IDCheck sees the drive.

Any suggestions? Or do I have to mail it back to the dealer? By the way I verified that the AdSCSI adaptor functions satisfactorily with a Mac hard drive.

Thanks,

>>
>...In fact, the company also sells MAC's which happen t o
>COST more, which, btw, increases their profit margin.
>The thing is, the only competition in the music field for the Atari is the
>Mac, which is inferior...(their sequencers suck - I have used them)

This is very interesting, since the last time I was in Saved, they
were still very pro Atari. In fact they had a mac and an Atari
sitting next to each other, and I watched them show the differences
to customers, and make it VERY obvious that the Atari was running
circles around the mac, and then let the customer know the relative
costs of the units. Guess what sold ? The latest catalog is full of
mac stuff, and Atari has one little corner on one page, so I would
guess that something has happened to cause a radical change of
direction there. I, however, will not speculate what this was.
I will say that my mac iici ($9000) at work crashes far more than
my Atari in the studio, and I am pushing the Atari MUCH harder. I
am not impressed with mac music software, and have had mac owning
friends come over to my studio to do things that their mac would not.
To sum up: I will stick to Atari for music.

>floppy drive to 1.44Meg without having too much trouble?

While we're on the subject - what TOS version do new STe's come with
thesedays? - I bought one about 18 months ago with TOS 1.62, and the way things
are going it might soon be cheaper (or nearly as cheap) to buy a new computer
rather than upgrade the OS - so do new STe's come with TOS 2.x?

Atari really are letting Amiga whip their proverbial ass at the moment. The Falcon appears to be little more than a lot of hype at the moment whilst the Amiga series is much more tangiable and (from what I see down here) popular.

Come on atari, isn't it about time you gave us a machine that will show Amiga exactly what Atari are...a very good company who produce very good hardware.

This used to be the case, but I am beginning to think Atari may soon slip into oblivion if they do not get their fingers out.

945. Compatability and attitudes

Newsgroup: comp.sys.atari.st
Date: 1993-01-15 13:42:36 UTC
From: mapmh@gdr.bath.ac.uk
Message-ID: <1993Jan15.134236.9255@gdr.bath.ac.uk>
Source record: 211985

I've been having a discussion with Neil Forsyth about dodgy programming on such machines as ST's and obviously on to Falcons etc, it would seem that one of the problems with programs is perhaps the approach to writing them in that programmers just see the machine as a games machine or perhaps a one time application machine - the user sticks in a disc and turns the machine on....and switches off when he/she gets bored. We'd need a change of attitude towards more serious applications before programmers would feel the need for writing programs that did things legally and became more compatible with future generations of machines. Of course I'm not saying that all programmers do this, but whilst a significant number of users only work from floppy drive systems the incentive to write legal programs doesn't seem to be there.

Anyone else got any thoughts on this?

Mark

I could be mistaken (correct me if I'm wrong) but I read in a book somewhere that the Linea routines are called BY the VDI. If this is true, then isn't using VDI bound to be slower due to calling two routines instead of the Linea directly.

That said however, I certainly wouldn't use Linea to write to the screen. If you really need fast graphics, write some assembly language line draw routines then YOU are the one who is responsible for compatibility issues, and not relying on the (unguaranteed) LineA calls (see STWORLD back issues for some real corkers on these lines, written by the guy who wrote Magic Fly).

948. Hexmines v1.2

Newsgroup: comp.sys.atari.st
Date: 1993-01-15 14:23:18 UTC
From: doucet@ripolin.laas.fr
Message-ID: <8640@laas.laas.fr>
Source record: 211988

To all people who have liked Hexmines:
the new version 1.2 is being uploaded at a.a.u.e and
should soon appear in the Games dir.
It's already available at sun.rz.tu-clausthal.de.

To all other people: it's a mine sweeping game on a hexagonal
grid; try it only if you have a color monitor.

Spider (another game of mine) has been uploaded at clausthal
yesterday; it's almost the same version than the one at a.a.u.e.
(only minor modifications in displays).

These games are for STs/STEs only, no TTs, neither Falcons.

Bye, Jed.

949. Re: Dead keyboard wanted

You might not be able to get a velocity and /or pressure sensitivity for $30, since these features are usually found on upper-end synths.

There is another option, which could be cheaper. Go down to the local music store (preferably the one you patronize - they might be more accomodating), ask for the repair tech, and see if he has any "junk" in the back you can go through.

I did this for a class during my undergraduate work, and the local store _gave_ me a junked keyboard.

All anyone can do is repeat what Bob Brodie said in his GEnie conference: "MultiTOS will be released for 68000 owners." The teaser he added is that it now fits on a single floppy (albeit a high density one) and that he is going to try to get permission to make it available free for downloading from GEnie (and then other boards). Will have to wait and see if that happens or not.

We all know that would be the wisest move by Atari but ..... ;-)

Dear All,
We have just recieved our Falcon developers kit from Atari UK, but
alas we have no Falcon Specific documentation or programs for it.
We are running GFA Basic 3.5E successfully but are having problems
displaying SuperVGA res piccies, particulary bitmaps (.BMP).
They seem to come out in negative colours.

Has anybody got any solutions (like- does the GEM call actually SET the
palette ??)

Has anybody got any Falcon Specific programs I could have.
Anything that make use of it's features.

Any documentation (especially programming) would be helpful.

Thanks in advance,

Antony.

You want TOS 2.06, not 2.05. TOS 2.05 was the early release of 2.06 for MegaSTe machines. TOS 2.06 will work in your 1040STf but you may need an adapter board of some sort to install it. You can buy one ready-to-roll from CodeHead Technologies (including the chips) or you can build your own (the instructions for doing so were uploaded here last month). I'm not sure how much the chips alone are going for now. $60? $80? In any case, next to a hard drive, a TOS upgrade from 1.0/1.2 to 2.06 is probably the most productive, cost effective upgrade you can do for your Atari, IMHO.

Atari have really done it this time. Not only have we been made to wait far to long for the Falcon (and they have totally missed the boat now the A1200 has been around so long), but they have botched the bored up too. They have designed the machine around a 16-bit data bus so it only runs about half as fast as it should, but the compatability with the old st is so poor that the extra chips they've put in (i.e. old sound chips) to make a vain effort of compatability with the st are a waste of money to Atari and to us.

Source record: 211852

Hello everybody,

I am one of the people that mostly just reads the newsgroups and does not write a lot, because of the fact that I haven't got much to say. Lately there is a lot of talk about how good or bad Atari computers are and how good or bad PC's are. As usual I was not planning to get involved but I couldn't resist anymore :-)

Here at Philips Medical there is a somewhat different situation regarding computers. There are those who just wan't a PC and do everyday's work on it, others want to use the VAX and there is an growing part who are using SUNs.

I think that the future of PC's is also, as is Atari's future, a short one. There is not much to gain in power of PC's. Does anyone know anything he/she want's to add to a 486 machine besides more memory, more HD-space more pixels, etc? I think that is the main argument. The Atari line is a loser in that way. The whole line of Atari computers isn't as previously stated easy expandable (I don't say it isn't, but it is more difficult than a PC).
The point however is, is that I think that the end of expandability is reached for the PC line. The main problem PC users have nowadays is lack of memory, extern as intern. Extern is no problem, just save some money and buy a new HD. Intern is a more difficult story. Sure you can just pop in a SIM/SIP or alike. But is the program using it? We have here several 386/8Mb PC's. There are several applications which just see the main 640Kb in memory and are incapable of adressing the rest of the memory. Atari had to chose the same route when they created the TT. After 14Mb no more ST compatible memory, and from experience the same problems result.

I must say I have read all the flaming with much interest. It is really fun to see how people get annoyed or angry. No one excluded. I do own a TT and are satisfied with it. And yes I know it was a stupid choise to buy a TT, but then again I am a bit stupid and strange. I just like my TT with it's cheap large screen (TTM195). I suppose I could get a very nice 486DX system for less money, but I am an Atari fan. I can't help it. But if anyone asks my opinion on which system to buy, I recomend them A SUN if he can afford the HW & SW for it, else buy a PC. If they want to go into the world of no updates, programm all drivers youreself etc, then buy a fantastic TT/Falcon or a cheap ST.

Finally, to set the score somewhat straight for Atari. (Hey, I said I was a fan!):

When I bought by TT, the harddisk woes after a few weeks. The same story applies as stated somewhere, I got a new disk without problems. I took the TT to the store and they mounted the new one in while I could wait. Also when I wasn't totaly completely content about the black pixels on the TTM195, they send me

a new one without problems after which I returned the old one without paying anything. When the 1.44Mb upgrading started I got enough hints from Atari Benelux to get it working. Just not the internal drive :-(.
Just some stories to help the score for Atari from 100:0 to 100:0,1.

Greetings from Limburg in the Netherlands (Oh, that figures!)

Marcel.

Right. Now doesn't that make you feel good? A month's delay, not because of faulty equipment, but faulty testing.

Great.

David.

Well since I have a useable hard drive with an ICD controller, I was wondering about disk decompression and bad sector checking. I see that Diamond Back offers Diamond Edge which does both bad sector check and decompression. I see that ICD offers cleanup which seems to be the defacto standard Disk Fix program, but doesn't do disk compression.

Which program do you recommend?

Are my recommendation questions annoying? I was hoping that these questions would spur interest in many people, not just for myself.

I ask that you post responses to the net, but I will also summarize.

I'm part owner of a company that is currently a small-time developer
for the Atari line though we're trying to expand in the Atari market as
well as move to other platforms.

I personally handle and respond to every correspondence we receive. I
am not aware of one dissatisfied customer of ours.

The only problems I have had with other Atari developers are those
overseas. I'm not sure why.

mforget@elfhaven.ersys.edmonton.ab.ca writes:
>I am looking for a definite answer, though. Will it be available for the
>68000 systems?

You won't be able to get a definite answer on the Internet (as far as I
know there are no Atari spokespersons on the Internet). So I hope you'll
be satisfied with an indefinite answer:

As far as I know, MultiTOS *will* be available for 68000 based machines.
We don't really recommend using it on such a machine (it will be slow,
and there will be no memory protection). But I believe this will be
an option.

Please note all of my caveats above. I work for Atari, but I am not
an Atari spokesperson. I don't set policy, either. It's entirely
possible that I am mistaken about it being available for the 68000;
I'm just reporting what *I personally* believe will happen.

Well, the lost profit on the Atari computer is only part of the damage.
If someone buys a Gemulator and dumps his Atari, it's not likely Atari
will make any further money on peripherals (hard disks, floppies,
monitors, ...) is it? The user will have effectively left Atari right
out of the picture.

> After all, who will buy Atari software when it's almost

What I'm wondering is will this Multitos on Disk include the new desktop? That is all the features of Tos 4.01? I'm thinking of getting Tos 2.06 for the New Desktop but if it comes with Multitos then I won't need 2.06.

So what's the story? Is the *complete* operating system on disk or is it just extensions that run on top of whatever Tos your machine has in it?

Hi! Has anyone got a notion of an 040-board for the TT?
At least I know of an board for the ST: the german magazine 'ST-Magazin'
currently publishes articles about a 040 self-made-board for the ST, which
they want to sell in the near future.
But, I've heard of none for the TT yet, just some 50-Mhz 030 boards for immense
prizes. If anyone has ever heard about such a board, please tell me!

Actually I doubt that's the case, since the 68030 has more
general-purpose registers. If we give the much-maligned Falcon the
benefit of the doubt, we can probably guess that you'd need a 33 or 40
MHz 386 to get roughly as much work done in the same amount of time.
The only way to know is to try your favorite software on both and see.

980. The Unnkulian Unventures : Commerical Quality Text Adventures for FTP

Newsgroup: comp.sys.atari.st
Date: 1993-01-15 19:27:57 UTC
From: dmb@case.ai.mit.edu
Message-ID: <1j737tINNbrr@life.ai.mit.edu>
Source record: 211869
Cross-posted to: rec.games.int-fiction,rec.games.misc,comp.sys.mac.games,comp.sys.ibm.pc.games,comp.sys.atari.st,rec.games.programmer,rec.arts.int-fiction

NOTES THIS TIME:

I haven't posted this announcement in a while because I've been busy getting our NEW games ready. Look for an announcement about "Unnkulia Zero: The Search for Amanda" and "Unnkulia 1/2: The Salesman Triumphant" in early February. (Yes, we do mean 1993. We know it's been a long time coming!)

The NEW version 3.0 UU1 and UU2 now use virtual memory to run in less real memory. Additionally, they now use the BIOS for text output (on PC's) and therefore support text-to-speech programs used by the visually impaired. We are interested in hearing from people making use of this feature in particular.

Also, there's a new UNDO command that lets you take back commands you'd have rather not given, like "jump off cliff." Oh yes, and lots of bugs have been fixed and inconsistencies made consistent.

I'm working on the Atari port of TADS 2 now, so new Atari versions of the games should be available soon. An Amiga port is also in the works, but not by me, so I don't know the time frame for that one. Unix ports are on the way as well (with luck).

The Unnkulian Unventure Series
Interactive Fiction for the 90's

Remember the good old days, when adventure games challenged you with great puzzles and evocative descriptions without resorting to using any graphics at all? We really miss the emphasis on gameplay rather than glitz, so we've decided to write our own adventure games along the lines of the early games we liked so much.

If you're looking for top-quality interactive fiction comparable to 1980's commercial offerings, check out the Unnkulian Unventure series of games, shareware text adventures available from an archive site near you!

In _Unnkulian Underworld: The Unknown Unventure_ you play the part of Kuulest's slave, and must recover the Orb of Studosity from the evil Unnkulians. Kuulest, the old geezebag, has died and left you with nothing to go on but a cryptic message about saving the planet. You'll encounter amazing Acme products, the infamous Guardian, those witty creatures known as Drolls, a giant beaver, and even the Dread Unnkulian Warrior. <Gasp!>

In _Unnkulian Unventure II: The Secret of Acme_ your adventure continues as you try to create some good press for yourself -- wouldn't want to fade into anonymous obscurity, now would you? Along the way, you'll find the answers to these compelling questions, and more:

o What happened to the Unnkulians?
o Why are Acme products so bad?
o What is this cheez stuff, really?

Plus, you'll get to explore Dawg Rock, a Duhdist Retreat, Acme's clandestine prototypes laboratory, and even pay a visit to Acme HQ.

The Unnkulian Unventure games have already gotten rave reviews from numerous adventure game connoisseurs around the world, so why not give them a try?

The games are available for FTP from ftp.gmd.de:

PC and compatibles:
---

if-archive/games/adventions/pc/unnk1v30.zip
if-archive/games/adventions/pc/unnk2v30.zip

Mac:
---

if-archive/games/adventions/mac/unnk1v30.sit.hqx
if-archive/games/adventions/mac/unnk2v30.sit.hqx

Atari ST:

(The 3.0 versions have not been ported to the ST yet.)

if-archive/games/atari/unnkul12.arc
if-archive/games/atari/unnk2v20.arc

Amiga and Unix:

We're workin' on it. :)

Both Unnkulian games are shareware ($10 registration fee for each) -- registering gets you maps and hint sheets from the authors. Support us and you'll continue to see fun text adventures like these.

Questions and comments are welcome!

Dave Baggett
dmb@ai.mit.edu

Appendix A

Where to get TADS via FTP:

TADS (and TADS goodies) are available for the PC, Mac, and Atari ST, from ftp.gmd.de. Look in the if-archive/programming/tads directory.

TADS is also shareware, and we strongly encourage you to register it since we feel it is a powerful, innovative, and very inexpensive development system that deserves to be paid for.

I doubt seriously if you could even FIND a new 10Mb drive anymore and it would be a big mistake to buy it if you could, IMHO ("white elephant syndrome"). 20 Mb units are still available but a 40 megger shouldn't cost that much more. I'd recommend you consider buying a used drive if you can find someone willing to sell. Used SH204's and third party drives are plentiful and usually cheap.

The type of pirates you are referring to sound like people who log onto bbs's and are actively seeking pirated software.

My experience with piracy in the dos world is average users who wouldn't know a bbs if it hit them in the face, but who rip off all their software from work. ALL of the pc owners I know have ripped off software from work. I would not consider the great majority of these people to be hackers or pirates - they are just your average pc users as far as I can see (and average pc usage as far as I have seen involves the attitude that users are entitled to free copies of commercial software - not shareware, but commercial software). Maybe as more companies get busted for using illegal software, this attitude will change.

Following on from a post about who is handling the Redacteur word processor. it is distibuted in the UK by The ST Club, 2 Broadway, Nottingham, England. They also publish the wonderful "ST Applications" magazine for us "serious" Atari users ie no gamesgamesgames. Well worth the 15 quid a year subscription. They also distribute lots of other very worthwhile software and maintain a huge PD collection. No connection, just a satisfied customer.

>AdSpeed...no?
>
> -Matt

AdSpeed isn't a chip, it's a daughterboard. If your 68000 is socketed
then all you have to do is pop out the 68000 and plug in the
daughterboard and then solder in one jumper wire. If your 68000 isn't
socketed then you'll have do desolder it and install the supplied
socket, which is a bit more work (and I wouldn't recomend it if you
haven't done that sort of thing before).

I've had great success with my AdSpeed board. The supplied software
options let you switch speeds in several different ways. I haven't had
any compatibility problems, and some operations (like expanding an arced
file) are much, much faster. Also, get Warp 9 from Codehead if you
don't already have it, as it will speed up your screen draws
significantly.

The Falcon will display all three ST resolutions on whatever monitor
you happen to have plugged into the thing!

(It interlaces or something like that to get the 640*400 for ST-High)

>over here have made it work).

It works perfectly well on my 4 Meg 1040 STE..

>Use Ultra-Pack if you are going to do something like that, as it compresses
>the data a LOT better than Magic-Shadow!

But Ultra-Pack, at least my version (I think it is 1.0) is so slow
that I can't bare it.

>Or try & locate the macig shadow (version 1.31 or something), that has
>a better compression in it (put in by a third party....).

There is one "third party" version that I know of, and that is 1.41,
and it hasn't got better compression, but an option to use no
compression at all, just stuff the disk into one big file. The packing
will then go faster..

Buy Amber-Star if you enjoy RPG/fantasy type games, it looks *GREAT*!

On this subject, let's try something a bit more peaceful!

What is everyones favourite game/s!?

RPG, Shootemup, Platform, Puzzle, Racing, adventure etc. etc.

Myself, I think that No Second Prize is one of the best racing games I've seen for a long time. (Good 3D graphics etc.)

Best Shootemup. Turrican 2

Most addictive game. Paradroid 90

Favourite adventure game. Indiana Jones & The last crusade (lucasfilm)

RPG. Dungeon master of course! (It's the only one I've got!)

Platform. Haven't got any. Lode Runner isn't bad though! (hardly qualifies however)

Puzzle game. Puzznic!

>Photochrome 3.0 is also available on the above site.

One thing to consider - when you convert a JPG to GIF, the 24-bit
palette is shrunk down to a total of 256 colors (I dunno about the palette).
This is because GIF only handles up to 256 colors out of how many.

You *might* get a better looking picture by converting the JPG
directly from JPG to RAW, as I believe they both support 24-bit,
and thus no colors would be lost. Of course, the resulting file
may be huge (though I think you could use ICE 2.40 to pack it -
check the Photochrome doc on that). Anyways, then you would actually
have more than 256 colors on the screen (whereas GIFs would only
give you 256 tops)...

Message-ID: <1993Jan15.215952.15023@cs.nott.ac.uk>
Source record: 211881

Fellow AtarST's, I am seeking recommendations for a couple of enhancments
to my 1040STe.

Firstly, second floppy drives. There seems to be a 30 pound or so difference
between the commonly advertised makes but the ads give no clues as to features
or requirements. The only "wish" I have is for a self contained power supply
as I HATE those external blobs that take up just-too-much space on my 4-way
mains adapter to get anything in next to them.

The second is a battery backed clock, are there any that fit inside the case
of the ST as I need to keep the cart port free for my Cubase dongle, and the
thought of having two thru'd carts (ie forget-me-clock thru) flowing inele-
gantly out onto my (physical) desktop to be knocked and possibly dislodged
with the power on makes me shudder !

Lastly is it possible (or worth it) to upgrade the 1040STe to Tos 2.x from
1.6 or is this the preserve of MegaSTe and TT, any software compatibility
problems likley ??

Many thanks in advance.. Dave Valentine-Hagart ..An ST is for life
not just for Christmas..

>benefit of the doubt, we can probably guess that you'd need a 33 or 40
>MHz 386 to get roughly as much work done in the same amount of time.
>The only way to know is to try your favorite software on both and see.

So supposing one could upgrade one's Falcon to 32 MHz this would actually
make it a decent machine now wouldn't it? Of course, this doesn't address
the issue of Atari management/developer relations and their so far el-cheapo
approach to marketing, the lack of a unix OS, the upcoming challenge from
the Commodore DSP board and the 3do, the vaporware announcements, and
the need for a totally new desktop look... Of course, even if someone
were to make a way-cool desktop for the ST, I'm sure Apple and Microsoft
would sue this person to oblivion so I guess I can't really blame atari
too badly for this...

So if we just add the price of said upgrade to a Falcon we'll get a better
idea what it's really worth...

So I have a question for you Dave, why haven't you bought an amiga? They
seem a little bit more stable for now... I unfortunately agree that only
the PC and the mac have rock-solid stability right now but a little risk
is good for the heart...

So now I am going to get some stuff about the desktop off my chest. It would
be really really easy for someone to make a NeoDesk like enhancement for the
ST that made it look a lot like microsoft windows. I'll bet it'd run a whole
bunch faster too. Heck, if I get a Falcon, I might be the one to do this if
the OS can already do the multitasking and all the hard stuff... I am not
heavily experience with Microsoft Windows and OS/2.0 but assuming that
MultiTOS does indeed come out, just what do these system have over TOS other
than cosmetic appearance? Personally, I think the NeXT interface is better

than any of them...

Scott

>
>I am looking for a definite answer, though. Will it be available for the
>68000 systems?
>

According to Bob Broadie during a RTC on GEnie, Bob said that
MultiTOS *would* work on 68000 AND 68030 machines, so according
to him the answer would be yes.

No doubt it would be slower on a standard ST, but it should be
decent on a 16mhz (like my MegaSTe :-). The only other "iffy"
wuld probably be the memory protection, which the 68030 has, but the
68000 doesn't have. So no doubt the 030 machines would have
a more robust time of it.

Besides, they should not worry completely about it not being
extermely fast necessarily on a 68000. I use Windows 3.1 at work
on a 20mhz 386dx, and simply running FTP, Telnet, and Pcplus at the
same time drags it down like a dog. I just happen to like being able

to keep things going on continuously, rather than having to wait
till one thing's done to start again. Besides, even MultiGEM on
my MSTe goes at a good pace (ok, except for zmodem, but maybe
if MultiTOS allows priority settings, then I can adjust that).

Whether they release it freeware (NOT PD) or commercially, I'll
get a copy. It was worth it when I traded up from TOS 1.0 to 1.4,
and then 2.05 on my current machine, so I'd consider the
advantages well worth any cost paid.

My personal opinion - they should release it "postcard-ware."
That is, if you're using it, send them a postcard as "registration."
At least register in some way - let them know how many people are
using it - that could help them market it towards developers,
and in turn help us by having more new software.

Well, whichever way they go, it's looking a little better...

Just buy any Amiga or PC joystick you can find (as long as it's not one
of those funky analog joysticks)... _Carefully_ take it out of the box
(and keep the receipt!) just in case it doesn't work, and you have to
take it back.

I've got a nice Wico "Bat" Joystick... Found it for $10 at a surplus
store.

I use the 9-point (or is it 10-point?) Gemini Bold font from the Gemini
desktop replacement package. 80x24, with the scrollers and title bar,
and whatnot. The 9-point Gemini Bold is only a bit smaller than the
8x16 monochrome font I usually look at...

> It does background downloading!? So, it's
> not a major extra. You still have to wait for it, and it's slower than
> single-tasking downloading.

xyz usually gives me ~234 CPS, STalker gives me ~232 CPS. That's about
1k of data less every 9 minutes...

From what I've heard, you just plug it into the "MegaBus" slot (which is
a 68000 PDS, exactly the same as the slot in the Falcon030) and awaaaay
you go at 16Mhz.

Does the AdSpeed have a cache?

> almost the same rez!

Not even close, without ScreenBlaster. These days, everyone has a 1M
video card... they almost all do 1024x768x256 colours. Many of them can
do nice modes like 320x200x32000...

> Its too bad that you're ignoring the Falcon's capabilities but let me ask

> If you're NOT comparing to the Falcon, surely you know that the ST is not
> multitaskable ('cept with Mint) so there goes your example...

How can you defend something you've never seen with something people
have been buying for _years_?

PC video doesn't take up any of the computer's RAM (well, ok, maybe 64k
in "high" memory), it's on the card. Windows usually runs at 640x480x16
because the poor fool has pathetic drivers. At work, mine runs at
1600x1280x1.

If the Falcon could do multitasking, you'd be complaining about the
"small" resolutions (ie, 640x480 with overscan) too. 1024x768 is much
more appropriate for all those programs running at once. Granted,
unless MultiTOS is made available for free, most people will only be
running one program at a time, or running a few character-based programs
via MiNT and TOSWIN.

Actually, I think there's still instructions in the MS-DOG 5.blow manual
for installing it on a two-floppy-only system...

> At least I can access all of my RAM without the need of RAM recogniser
> cards etc - Shadow RAM!? Talk about primitive!

Shadow RAM is exactly what the TT program "ROMRAM" does... Copies the
ROM from the slow EEPROMS on the card to the faster RAM in the computer
so the whole system will go faster. It may sound "primitive" to you,
but I'd want to do it if I had a TT. TT FastRAM is probably 10x faster
than the TT's ROMs are.

The only problem is, some cards do it rather nastily... causing
incompatibilities with the big, multi-tasking systems that are becoming
popular these days.

>Hm, how exactly do these binaries groups work? --Are they exclusively
>limited to broadcasting things that have been submitted to the
>moderator?

At the moment, that's how both groups work.

>Or can the moderator go into the archives and post some
>interesting things from there?

We could certainly change the groups to work this way. My biggest concern would be that there wouldn't be a clear place to report bugs -- right now, you can send them to the submitter. But the group moderator is almost never the right person to report bugs to, and that's who'd be listed as submitter if pulling files from archives became common practice.

Also, I'm not sure I'd have time to do this (which doesn't mean it's necessarily a bad idea).

>Sure, it's easier to ftp, but a lot of us don't have ftp access.

What about ftpmail servers?

As an update: the consensus seems to be that allowing announcements of software on both groups would be a good thing, but that I should continue to post any software that's submitted. For now, that's what I'll do. So feel free to submit announcements of software availability. If your software is being made available on an ftp server, remember to include the server's domain name (e.g. foo.bar.edu), its numeric Internet address, and, if applicable, the directory and filename.

Would people object to allowing the atari.archive automated "new stuff" articles to be posted to comp.binaries.atari.st instead of (or in addition to) comp.sys.atari.st? That seems like a natural sort of announcement to allow on a regular basis.

Also, should announcements be archived? If so, in what form?

-Steve

I get that one when I try to compile the TIFF library for the new (well,
10dec92) version of PBM-Plus (since there's no compiled version out
there for the ST with all of the programs in it; the one on
atari.archive is so minimal as to be useless for me). A friend of mine
got the message on his 20M TT too...

> I could go on and on with this, but will leave it for now. Hope it helps.

Nope, just kept the flamewar going another day... Good thing, it's cold

Actually, the '030/'386 and '040/'486 are much closer than the '000/'086
ever was... A 16Mhz '030 is about the same as a 20Mhz '386.

While this is a popular rumor it just isn't the case. According to Bob
Brodie's conference on GEnie this week, the delay is due to the poor quality
control of the current assembly line contractor. Too many units were failing
to meet specs. Supposedly this has now been worked out (or is in the process
of being worked out).

It would be nice to think that the delay is due to a secret graphics wonderchip
that they decided to install in the last minute but alas, it ain't so. This
falls into the same category of the rumors that the Falcon is delayed because
they decided to put it in a TT-like case. Sorry, not yet folks. <sigh>

No-can-do on a Falcon... No VME slot for the Ethernet card. Rumour has it that there are VME Ethernet cards for the TT and even an X server, but nobody seems to have been able to find out concrete information to add to the FAQ...

In North America, you'd be completely out of luck, unless you could read German and wanted to order the goodies from overseas. Rumour has it (hmm, not rumours... not here in c.s.a.st!) that there are about 300 TTs in all of North America.

>
>Do you know ST owner's with pirated commercial programs? (not shareware)

Every person I know has pirated commercial software, no matter which
brand of computer they're using.
The reson behind it is probably a financial one, you can't afford
every piece of software that comes out, you figure you wern't going
to buy that one anyway, and it's no _physical_ loss to the manufacturer,
so you take a copy. Sure it's illegal, but it's not hurting anybody.
On the other hand, if you need that software, and you can afford it,
then taking a pirated copy is hurting the author of it.

>I don't know many ST owners "in the flesh", so I don't know any who
>have pirated commercial software. As far as shareware goes, it sounds
>like ST owners don't pay up very often (hey, I did register blox :-),

>processors, spreadsheets, compilers, comm programs) I see people
>ripping off.
>
>Of course, you could point out the lack of commercial software on the
>ST as being responsible for less piracy - there's less to pirate :-)

There's tonns & tonns of ST stuff pirated. I've heard that there's people
around the world that have thousands of copies of pirated software.
There are groups in some places in europe where it's perfectly legal
to copy anything (no copyright laws covering software) that crack
the protection off each new piece of software when it comes out and
release the unprotected version with their groups name all over it. These
copies manage to make their way all around the world so many ST owners
must be sharing pirated stuff around!!

I don't go for the commercial software much nowdays anyway, i've got some
shit programs that i've spent a bloody fortune on before, when the shareware
is better. I am guilty of not paying for shareware though.. but that's
because I can't afford it :-(
(the 2 worst commercial pieces of software i've paid for and regret ever
buying are Timeworks DTP.. pretty useless, and Mini Office Professional
Communications ... a terminal program, and about the best place for
that one is in my rubbish tin. Nearly every shareware program is better than
it, and I paid roughly US$45 for it!)

>I think the theft has arisen because of the popularity of the pc.

Bull! Software piracy has been around since the days of the C64 & ZX Spectrum
It's in our human nature that if we can get it free, why pay for it!

(I followed passively the flame wars and I hesitated to contribute to them,
so please forgive me for wasting your bandwidth.)

No, I won't flame you, just some more information from the user's side.
I just would like add our experience that ST/TT/Falcon are being
obsoleted by the possiblity to afford PC's with UNIX. PC's will fall in
price by - say - 40% per year.

Lots of semiprofessional users in our environment (German universities)
have changed or will be changing to 486-whatever with Linux on it.

This holds even if a 040 would be available soon.

If I understand it correctly, the German market has been one of the
strongholds of Atari in the past. If they are going to loose it, it'll
be very hard indeed.

Our department has 3 or 4 ST's left, in contrast to approx. 50 PC's now.
It's quite reasonable to generalize the situation to other German uni-
versities. Atari is already dead from our point of view.

Correct me if I'm wrong.
Thomas.

> do it once).

Well, I guess part of it's my fault. I asked why I should stick around
on the platform I've supported for seven years while I wait for Atari to
get their a** in gear with a 32-bit 32Mhz '030 machine or '040 machine,
since I need a general computing machine, not a music computer.

> And Dave, since you seem pretty good at this flame lark, you're not perchance
> one of the more well known flamers from alt.flame are you? (Posting under
> a different id of course).

No, but Dave's one of the great unsung heros of the ST world. His
software lives on many machines, and his Picture Formats list is the
only Rosetta stone ST owners have for the zillion picture formats in
common usage.

He's also becoming a fine example of the "fantastic user base" of Atari
computers. As soon as he bought a '486, and dared claim it was faster
and more productive (for _him_) than his ST, people jumped all over the
"traitor", conveniently forgetting his contributions to the ST world.

> PC clones! Ha! I get much better performance on my Cray!

You can get a Cray for under $1000? Do they take MasterCard?

All versions of DOS made for the IBM compat's in about the last 5 years
has been programmed by Micro-Soft (aka Mega-Slow).

PC-DOS was the original name, and is now too old to be any real use.

The oldest version anyone should be using is 3.3 Older versions are
a bit flaky on some of the more 'modern' software. (Due to different
memory locations being used etc.)

A lot of stuff is not OS/2 compatible. (Also, a lot *is*). It may
be powerful, but if you have only a 1meg machine, with about a 50meg
Hard-Drive, stick to plain MS-DOS! (Windows won't go, at least, not
without eating all the RAM - try running Telemate 4.0 under Windows 3.1
with 640k RAM. It won't go!)

Source record: 211914

TOS 2.06 is to 2.05 what 1.62 is to 1.6! (It fixes a couple of the
larger bugs...)

You can put a 1.44 meg drive in a Mega-STE, but make sure your drive
controller chip can handle it. (Some versions will literally blow
up under the strain - get an AJAX chip, if you can use it in the MegaSTE
and it'll go like a charm!)

You can use TOS version 2.06 in the Mega-STE. To my knowledge, versions
3.xx and 4.xx will not work due to different hardware being accessed.

the 'Shift SD' causing the same effect as pressing F1 seems to occur
quite often on my machine too! (Those exact same keys, put my
ignore thread macro onto the screen). I'm using FreeZe Dried Terminal
at the moment, but have had this problem with virtually every comms
program I've used! (Except Uniterm, as I never used it's macros' 8-)

Anyone explain why this happens and/or how (if possible) to fix it!?

> So much as I regret it I will almost certainly buy a PC clone soon. Even
> though my heart says Falcon my Brain says PC. I'm afraid anyone buying a
> Atari is living in a dream.

(much deleted).

All this is old news. The 'PC' (aka Personal Computer. Which includes
Atari's, Mac's, Amigas etc. so it is a stupid term). market is
far, far bigger than the ST's (and everything else), because it's
been around, virtually unchanged, for the longest! (Okay, mac is pretty
close, but the price soon fixes that!).

So, the most software exists for them, the most people use them, etc. etc.

It doesn't matter how much is available for the machine, because as you
say, the IBM compat's are very inferior. But, are 'better' because
of more software & hardware being made available.

I for one, couldn't care if I had a 386, a Mac Plus, a Falcon, or my
trusty 1040STFM I have here. Any one of them could fulfull my needs.
They all have comm's packages, they all have word-processing &
spread-sheet packages. They all (of course) have games (although, the
mac' doesn't have a heck of a lot, but it does have some goodies, like
Prince of Persia etc.). I'm going to keep my ST until I need something
better, (and I can afford it). WHich will be whatever suits my
purposes at the time! (Which *won't* be an amoeba games machine, that's
for sure 8-)

So people, stop complaining that 'I want a 'pc' not an ST' etc. because
people don't *really* care! It's the person -yourself- who is the
only one affected! (Unless you buy a huge quantity etc.). This is
an Atari message base, so, unless it's something of great importance
(e.g. IBM have just created a 686 with a 130Mhz Processor, and
higher than Television quality graphics & sound) it's hardly a great
problem!

WHy can't we just stop saying the obvious, and get back to *ATARI*
postings!?

1029. List of all ST models/features

Newsgroup: comp.sys.atari.st
Date: 1993-01-16 06:33:38 UTC
From: sourada@iastate.edu
Message-ID: <sourada.727166018@vincent2.iastate.edu>
Source record: 211917

It's been suggested that I should add a list of all ST models and their features to the FAQ. Here's my first guess at one. Please send me corrections and additions. (The article in the FAQ will look cosmetically better than this, I'm doing it this way now to save typing...)

I'd like to have a chronology, if someone knows the release dates...

Base models (8 MHz, TOS 1.0, no blitter, no audio/video enhancements):
130 ST (rare) - 128k
260 ST (rare) - 256k
520 ST - 512k
1040 ST - 1M

With blitter, TOS 1.2 or 1.4:
Mega 2 ST - 2M
Mega 4 ST - 4M

With blitter, TOS 1.6 or 1.62, enhanced audio/video:
1040 STe

With 16 MHz, TOS ???, enhanced audio/video:
Mega 2 STe
Mega 4 STe

With 32 MHz 030, TOS ???, enhanced audio/video:
TT

With 16 MHz 030, TOS ???, 32 MHz 56001 DSP, much enhanced audio/video, etc.
Falcon 030
Falcon 040 (wishful thinking :-)

Later,
Steven Ourada

>the PC and the mac have rock-solid stability right now but a little risk
>is good for the heart...

I think sinking money into an Amiga system would be just as silly as sinking money into an Atari system. Both machines still represent the 80's idea that you can sell "home computers." With the advent of dirt cheap PC's (and whiz-bang international DTP stuff on the Mac like WorldScript and smooth 24-bit video handling), the home computer market has evaporated, and has been replaced by a tremendous demand for professional machines people happen to use at home. (Professional in the strict sense of "what you use at work.")

We've seen the game console/home computer/workstation continuum of the 80's transform itself into a strict game console/workstation dichotomy. The masses of people who buy machines for their homes now know that if they just want awesome games they should get a Sega or Nintendo for $80, whereas if they want to do spreadsheets, word processing, or "telecommuting" they'd be better off with what they have at work. (Many people buy both, I suspect.)

Perhaps the vacuum where the middle of the continuum used to be was created *because* Atari has bungled so much over the past 4 years. On the other hand, it may be that the changing market has driven the last nail in the coffin. Who knows.

>So now I am going to get some stuff about the desktop off my chest. It would
>be really really easy for someone to make a NeoDesk like enhancement for the
>ST that made it look a lot like microsoft windows.

There's a lot more to Windows that just the interface, and when you start talking about Windows NT you're really getting into a major amount of manpower. You most certainly couldn't do it by yourself. Why you would want to make your Falcon look and act like Windows is beyond me anyway.

>same thing. They don't do that, and therefore there's no official,
>Atari-sanctioned standard CLI that you can always assume people will
>have.

I saw some messages recently about a CLI called Okami in the fidonet
atarist echo saying that it was the best.
(I've since got in touch with the author, who kindly mailed me a copy
of the latest version. It should also be on a.a by now.)

Ubnfortunatly it only has German docs, but it's suppost to have the most
features.

Has anyone here used both Gulam & Okami? which do you think is better?
I have't had a play with either yet, i'm still using Mupfel - mainly
because it sort of set itself up with Hermes, don't ask me how, I woudn't
have a clue!!, the others can't find the files on the HD, I guess I need
to figure out how to set them up.

I'd be interested to see what other people that actually make a lot
of use of cli's think of it?

Craig.

>> are in the same boat as me.... they can't afford to move on.

>To answer your serious question here, yes I will buy the Falcon, as I think it
>is the only machine which has got its act together.

No, sorry, I didn't mean it to come across that way, I was refering to
right now, why people are sticking with an 8Mhz ST rather than going out
and buying something a bit more fancy and faster if they had the money.

I should point out right now that I am definetly not anti-atari, or anti-pc,
or anti-anything else. I'm quite happy to support anything! I don't
really believe there has been a real shit computer on the market. Some
are just getting a bit old now, technology is moving along quite quickly.
I read a quote somewhere from a guy at IBM saying that if the motorcar had
advanced on the same proportion as microcomputers have in the last 10 years
then the average car would do 0-100 in 3 seconds and something else I can't
remember!
I like my ST, I wouldn't really want to leave the atari style of computer
(you know, the way it feels to use etc), but i'd really like something
with a bit more grunt. The PC is certainly the best value for what you
get here in NZ, aparently the PC isn't as cheap in the states as it is here
due to restrictions to protect the industry at home in the states, we don't
have an industry here to protect, so there are many cheap imports from
Tiwan.

>Reasons:
>1. It uses Motorola chips and not the Intel Chips (designed by idiots).

They are? They have to be compatable with previous versions.

>4. I am sick of using PC's, which is a standard here at my workplace. I have done

1035. Hermes ... forcing smaller packetsize???

Newsgroup: comp.sys.atari.st
Date: 1993-01-16 08:23:36 UTC
From: craig@yonder.equinox.gen.nz
Message-ID: <H.ea.zn_fcwpZ_ZM@yonder.equinox.gen.nz>
Source record: 211923

Help!

My site has decided to allow packetsizes of up to 4096 bytes now, whereas
it was 68 bytes before.

UUCICO is obeying what they want, and switching to 4096. This means
my polls are bloody long now! say I want to send a 100 byte message,
this is then padded up to the 4096 bytes, and so is every X file.
There's also a huge wastage when my site is chatting to the other one
between files with 4096 byte blocks.

Is there anyway to get UUWORK to tell UUCICO to stay at a smaller size?

many thanks,
Craig.

k>
k> You must have better eyes than me. :) Stalker probably lets you use
k> GDOS fonts or something, but it will look like sh*t and be unbearably
k> slow. Uh, Flash 1.6 does 50 line mode also...

Err, actually, they don't look like shit : STalker comes with a version of
the TMail ANSI font, which looks _really_good_... and if you have a halfway
decent screen accelerator (NVDI or Warp9) it will pretty well keep up with
9600 on an ST, something that Flash doesn't seem to all that well.

k> ken@isgtec.com [...!uunet.ca!isgtec!ken] Ken Newman

Having done my own analysis... *grin*

If you only have an ST, use Uniterm, you don't have the speed or need for
anything more.

If you have a Mega STe, an accelerated ST, or a TT, use either STalker
(whose VT100 is pretty good when you set it up right, particularly if you
disable it's default behaviour of clearing the history buffer on a
clear-home) or CoNnect, which is as close to flawless as I have ever seen a
terminal emulator get.

>HiSoft UK

New versions of `SciGraph' are called `Xact'. Note that there was no adaption for the Falcon: most properly written GEM programs work right away. There's no need to change anything, unless you want to access really new Falcon features (like the DSP or the sound system).

There is a cartridge that you can use, called 'The Ultimate Cartridge'.
It says in the ad:
<other stuff>-Look for music - Play music - Load and save
music - Search for soundtracker samples - Search for sound
samples - <more stuff>

It also claims that The Ultimate Cartridge 'will break into any Atari St
program'.
The price is 25 pounds and it is available from Power Computing in the
USA, France and Italy. I have seen an ad for it in every St Format magazine
that I own (the ad's just insdie the front cover.)

Regardz,
Matthew.

1043. MultiTOS on 68000

Newsgroup: comp.sys.atari.st
Date: 1993-01-16 10:42:24 UTC
From: boris@sys6626.bison.mb.ca
Message-ID: <D0TgXB1w165w@sys6626.bison.mb.ca>
Source record: 211931

After having just read the latest Znet Bob Brodie has said that MultiTos will be able to run on ALL atari machines (ST series to present)

The falcons are having production problems because of the FACTORY and not atari. This shortage of supply is world-wide and Atari is bringing a second supplier in to pick up where the first supplier has f*#$%%^ up.

It has had FCC approval since sept.
It will be shipping in quantity by march. NOT atari's fault. The factory has lousy quality control and is being taken to task for it.

Since when has an Amiga anything been worth squat????

PC's???? Just because thousands and thousands of computer illiterate persons are willing to buy a dumb machine for an outrageous price and slog thru DOS to run thousands of pieces of taudry software doesn't mean everyone is a herd animal. Load up your vaunted PC with enough cards to make it able to handle everything a stock ST does. Put in windows and norton utilities to meet the stock ST operating system, Run word perfect on your lauded PC is twice as slow as my ST and costs tree or four times as much.

I've played might and magic on a friend's PC and if that's the quality of your thousands of pieces of software, well I will die laughing it it for the rest of my days.
The ONLY reason for the PC continuing to exist is no one is willing to admit they got sucking and taken to the cleaners. IBM had a virtual monopoly back in the beginning and got a lot of people to invest in a machine quickly surpassed. Now they survive on the basis of the sheer inertia of the herd. Any machine where you have to load in A windows environment is archaic and not worth the plastic it's made of.

you can't compare the two machines. The moment you load any software into a PC it slows down! It never does on an ST.

To the guy what complained about the falcon being a vedio/music machine. A falcon has the capability and NOW in development for it is SOFTWARE to link two machines for use as VIDEOPHONES. The machine itself can handle voice mail with no more additional software than a cheap modem. It does TRUE multi-tasking unlike the PC and amiga which time-shares.

Anyone else???
To those about to rant at me:
Take it somewhere else. I really hate whinners. If you in new zealand feel had done by then get a Pc and get out of this sig.
Pc users go and stick to your own sigs too. Put up or shut up.

Now, back to Atari stuff.....

How can you be so sure on that? How much will it sell in Germany?? With english you have the US + most of the rest of Europe. I'd say a great sales potential. Atari could do themselves a favour and cover the translation costs... :-)

>reliable.

First of all, get more disk space than you need. You'd be amazed at the number of ways you can find to use it up. I imagine it would be difficult to find a 10 meg hard drive these days -- 30-40 megs is now the entry-point for most mechanisms.

I have one of the Power Computing drives -- it's basically a Seagate 42MB mechanism with GE-Soft controller. I understand that Power drives now come with ICD controllers and softare, which is A Good Thing -- the GE-Soft partitioning / bad-sector mapping / etc. software is bloody awful. The GE-Soft driver itself seems OK, but I digress.

Power are one of the cheaper suppliers, and they supplied exactly what I ordered, with some extra software thrown in, and delivered on-time. There are lots more hard drive suppliers in the UK -- check out Ladbroke Computing (they also do the Quantum drives with on-board caches), Progate, Evesham micros, etc. etc.

>You might not be able to get a velocity and /or pressure sensitivity for $30,
>since these features are usually found on upper-end synths.

You are right that they tend to be upper-end features (or at least not bottom-bottom features), but velocity sensitivity does not involve much hardware (the way it's implemented in many synths). My DW8000 does velocity by having not one but two contacts for each key: one at the top and one at the bottom. The electronics that "reads" the keys (actually microcode for the processor) times the difference between the top contact and the bottom, and deduces velocity from that. Since everything but the second contact is in ROM, it's not hardware-intensive.

A few caveats about my comments above:
- That's the way most keyboards did velocity-sensitivity 4 years ago and earlier. While I have no reason to believe things have changed, I haven't kept up; it may be different today.
- If the seller prices it according to the original price, rather than according to what's still working, the fact that it's so simple won't help you.
- Pressure sensitivity requires more "exotic" hardware to implement; my comments were just for velocity sensitivity.

>There is another option, which could be cheaper. Go down to the local music

I noticed a Motorola/Apple advert in Electronic World over the summer, showing the results from a laboratory had done real-life tests (wordprocessor/database etc) between a Mac 040 and several 486sx's.

The 040 running at '25 MHz just beat the '486 running at 50Hz, and was something like double the practical speed of a '486 running at 33MHz!

Once we get an '040 Falcon, then we can take on the big league with better than equal equipment!

I suspect that an '030 is significantly better than a '386 and a '386 with a DSP board doesnt count 'cause nothing would use it! Compare the Falcon to a like-specced '486...

David.

Oh no, I'm in a flame-war! What have I done?

|> a 1040STf? And if so does it come in a 2 chip version, how much?
|>
|> Stephan

Yes you can get TOS 2.06 to fit into an STf with an adapter board that lets you switch back to the old version if games don't work etc.

Oh the problems of multinational newsgroups that I don't know the price of it in the US, but over here it's about UKP 60 including chips. Oh, that's the STe version, I'm not sure about ST but I think it exists.

Also essential for using TOS2 is a decent Resource editor to make your own fonts with. With a little work you can get your existing NeoDesk icons to work with NewDesk and then life's nice again.

Best features of NewDesk are...

User definable icons
Complex application setups (similar to NeoDesk)
Programs can be run on Function Keys
User-definable keyboard shortcuts for any operation
A Help page! [Help on keyboard]
Open new window [Alt-Key]
Change new window to new drive [Ctrl-Key]
Open folder into new window [Alt-DClick]
Change window colours with XControl
Change desktop and window backgrounds.

Quite a list now I've written it!

David.

1053. Help needed with installing (dumping) emacs

Newsgroup: comp.sys.atari.st
Date: 1993-01-16 18:04:40 UTC
From: aeg03@rrz.uni-koeln.de
Message-ID: <1j9inoINN1bip@rs1.rrz.Uni-Koeln.DE>
Source record: 211943

Hi folks,

I recently got a copy of Scott J. Kolodzieski's emacs port. The archive unpacked without any problem. Following the instructions given in the accompanying docs, I created the appropriate environment variables and ran the dumpemac program, but it didn't work. More precisely, the r emacs, called temacs, gives an error message saying "cannot open load file loadup.el", and exits. Subsequently, the dumpemac program sees that no "xemacs" file was created, and exits too.
Of course, I messed around quite a bit in order to find out what's wrong. I tried running it under MiNT, under TOS, from various shells, with various settings of the UNIXMODE environment variable, and with various bootup configurations (nothing, MiNT only, TOS patches followed by MiNT, TOS patches only). The error condition remained the same, except that some settings of the UNIXMODE variable caused temacs to be incapable to find the e-lisp directory at all, resulting in a corresponding warning.
Under MiNT, I raised the error level. This revealed that temacs tries to read the *.el files from f:\emacs\lisp. The environment variable EMACSLIB is correctly set, though. Setting EMACSLIB=f:\emacs\nothing will lead to an error message from temacs, saying that f:\emacs\nothing does not exist. It seems, therefore, that the setting of the environment is correct, and that temacs successfully verifies that the EMACSLIB directory is present, but when it comes to loading the *.el files from there, it tries to load them from f:\emacs\lisp for some weird reason.

Has anybody out there successfully installed emacs? Does UNIXMODE require some initial configuration or installation to be done? I haven't needed UNIXMODE at all so far, and never did anything about it.

My system is: Atari 520 STm with 2.5 MB RAM, TOS 1.04, Megafile 60 HD with AHDI 5.0, MiNT 0.95, tcsh 6.00.02 (I think). The emacs package dates from 12. jun. 1992.

Thanx in advance for any help.

1058. LocalBus, PhotoCD, OS/2, high-res video

Newsgroup: comp.sys.atari.st
Date: 1993-01-16 20:28:04 UTC
From: cherborth@semprini.tdkcs.waterloo.on.ca
Message-ID: <H.ea.DpyzcL008PU@semprini.tdkcs.waterloo.on.ca>
Source record: 211949

In <1993Jan14.233247.13653@bsu-ucs>, 01mbmccabe@leo.bsuvc.bsu.edu writes:
> What is this whole LocalBus thing? Why have it? What are people missing out
> on who don't have it?

LocalBus (recently standardized by the "VESA" standard) is a way to increase performace a few hundred times... On most LocalBus systems, there are two VESA slots (also called VLB slots, "VESA LocalBus"). The CPU has direct access to the cards at the speed of the CPU, without having to go through the pathetic ~8Mhz ISA bus. LocalBus is a 32-bit standard, and there are many video cards for it (usually around 20-50x the speed of their ISA equivalents under GUIs). Most LocalBus systems also have significant amounts of RAM on the motherboard, for the CPU to talk to at its speed (the Zeos one I was looking at can take 64M on the motherboard).

People who aren't using LocalBus systems are waiting around for that 8Mhz 16-bit (or 8-bit) bus to get the data through... A 1024x768x256 screen is 768k of data, which is going to take a _long_ time to update. The system is significantly slower. LocalBus lets the system run almost as fast as the processor can go.

> What's the diggs on OS/2? If you have a system that can handle it comfortably,
> what will it do for you?

OS/2 is a multi-tasking, multi-threading OS, that'll run multiple DOS apps side-by-side (and multitasked), multiple Windoze apps, and multiple OS/2 apps. It does DOS better than DOS can (ie, faster, more RAM is available to the DOS programs). It provides protection for programs, like on a unix system; if one program crashes, it's almost never going to bother any of the other programs that are running.

It's got pre-emptive multitasking, which means no program can hog the system (unlike Windows, which is "co-operative" multitasking... if a program wants to, it can take over the system for an indefinite amount of time).

> What's the difference between single- and multi-session disks?

CD-ROMs are usually just "recorded" to once, when they're made. PhotoCDs can be written to more than once (they're a bit like a WORM disk; Write Once, Read Many), since they can hold something like 10 rolls of 24-exposures (in all of those 24-bit resolutions the PhotoCD keeps). A CD-ROM that has only been "recorded" to once is a single-session disc; one that's been written on more than once is a multi-session disc... Kodak calls each Roll o' Film -> PhotoCD conversion a "session".

Multi-session CDs need special, smarter CD-ROM drives; "normal" CD-ROM drives can only access the first session. So far, I think PhotoCD is the only thing that creates multi-session CD-ROMs, though more things that do it should start to appear once there are more XA CD-ROMs ("XA" means it can read multi-session CDs properly).

> What can't you do on a cheapo SVGA card that you _have_ to be able to do?
> Ditto for the monitor?

Well, most SVGA cards (with 1M) are around $100 these days... They're _all_ cheapo cards compared to the $500 you'd have to spend to get better resolutions on a ST/STe/MegaSTe/TT...

Hey, you don't _need_ anything more than 80x25 text anyway, so why bother with graphics, right? Well, the *biggest* attraction computers have for me is graphics, so the bigger the better... And in a GUI that lets you multitask (or even one that doesn't, like GEM) the more screen real estate, the better.

Yuck, forget the Classic!

Emulating an LC II seems reasonable, since the Falcon hardware has
pretty much _exactly_ the same specs as the LC II does. Better sound,
better graphics, but that's about it...

Now, where the heck is anyone going to get LC II ROMs from? Apple didn't
exaclty leap to provide Mac Plus ROMs to Spectre users...

Hmm, now that I think again, maybe it was $1400 for the 4/65 Falcon...
At this point, I don't think I'd buy it for more than $800, given
Atari's lack of _product_, their lack of a _market_ (beyond musicians,
which I am not), and their lack of attempts to get the thing out in a
timely manner.

Wings of Death is my favourite. Lethal Xcess (the sequal) is amazing
(I've _never_ seen so many things moving around at the same time!), but
too hard for me to get very far...

> Most addictive game. Paradroid 90

I was just thinking about that one last night... ;-)

Gods is the one I've been most addicted to... And Omega (but that's a
freely available game).

> Favourite adventure game. Indiana Jones & The last crusade (lucasfilm)

Gods

> RPG. Dungeon master of course! (It's the only one I've got!)

Omega. Dungeon Master was pretty good... didn't solve it though.
Ultima V is my favourite (since I'd already solved Ultima IV on my C-64
before I upgraded).

> Platform. Haven't got any. Lode Runner isn't bad though! (hardly
> qualifies however)

Gods!

> Puzzle game. Puzznic!

Not bad, but I prefer Loopz. Welltris had me going for a while...

Game that has no real category:

Pang (aka Buster Bros.)

Racing Game:

Lotus Turbo Esprit Challenge

Fire up ftp and look on atari.archive.umich.edu (or one of its mirror
sites), in:

/atari/Gnu/*

I think Howard Chu is the person to thank for the latest version...

Be warned that you'll need _at_least_ 2M of RAM (4M is much better;
you'll probably need 4M for C++ coding), and GNU C/C++ takes up about
10M of disk space.

Not that anyone buys any Atari peripherals, beyond the monitor (because
of those nasty custom monitor ports)... They're much too expensive.

I don't think Atari even makes "Atari" modems or printers or hard drives
anymore.

>because the poor fool has pathetic drivers. At work, mine runs at
>1600x1280x1.

It DOES take up much more RAM. Or do the data shrink in the main memory when
it's transfered from the videoram? ;-) It's a fact that Windows uses more
memory in 640x480x256 than 640x480x16 (and it crawls in 256 colors mode btw).
And the poor fool that has a pathetic driver wont die of old age waiting for
his screenupdates on a standard PC if he use 640x480x16. ;-)

I hate to jump in here but how can it not be Atari's fault? Did someone
else pick the factory? Did Atari ask Commodore to pick the factory perhaps?

We here at Solbourne take responsibility for the vendors we choose. I expect
no less from Atari.

Not their fault? What a cop out.

>I have the option (AND the right) to use this as an argument, as it is a
>REASONABLE assumption that at least 1% of a software market pirates.

You're sitting there saying "as it is a REASONABLE assumption that at least
1% of a software market pirates." , but on the other hand you're saying
for this reason PC owners pirate more than ST owners?!?!?
You're contradicting yourself!

>This is my last posting on this subject. I don't see the point in renewing
>this thread, as it serves no purpose. People have their own conceived
>notions, and I'm sure you'll find that in this case, mine is true.

Well a few people here seem to think you're wrong, we don't want
others being misguided!

>Final Statement:
>My position on this whole subject is :
>The *MAGNITUDE* of piracy on the IBM platform far exceeds that of the
>*MAGNITUDE* of piracy on the ATARI platform.
>Nothing you, or anyone else, say will make me change my mind.
>This has already wasted enough time...

You can look at the magnitude in several ways,
a. no of people doing it
b. percentage of a users on that system doing it
c. no of titles being pirated

Of course a & c are going to be a lot bigger then the ST, for the simple
reason that there's a hell of a lot more PC's out there than there are
ST's
But, my guess would be that b would be around the same figure. We're
all human, we're all into the same things. What makes it so different
for ST owners that they are inclinded to pirate any less than a PC owner?
I think not.

compression? You'll need something like Data Diet to compress data on your
HD, and de-compress it as you go.

I think, maybe, you're refering to banking it up to floppies in a compressed
form? If so, from what i've heard, Diamond Edge seems to be the best.
I don't know about it's checking and repair abilities, but Cleanup does more
than just looking for bad sectors. It checks the file structure, checks
for unallocated blocks, and fixes up the FAT (file allocation table) when
it's sussed out everything wrong. Oh yeah, it checks the HD for bad
sectors as well!

320x200x32000?? Child's play on the Falcon. Without the screenblaster, the
Falcon goes up to 768x428x256, btw. And I'm pretty sure the Falcon goes up
to 320x200x65536, 640x200x65536, the rest of the higher resolutions being
256 colour modes.
>

>1600x1280x1.

Well, when I put memory into the computer, voila!, more memory goes into the
graphics capability as well, whereas you have to upgrade both _separately_!
The "poor fool" doesn't have pathetic drivers, its just his computer's too
slow to handle it. Windows at that rez will be mucho slow unless you have
a 486-33 at least! Here we are comparing graphics capabilities, and then you
suddenly jump to a 1bit system... Do you know WHY its running at 1bit
(2 colours) ? Because if it was any higher, the system would be _extremely_
slow! Oh and also, the comparison is lousy as monitors that size are out
of consumer range (why do you think it's at "work")... At a recent Atari show,
I saw a 1800x1600(i think) screen on a TT running multitos and the screen
refresh was incredible. In fact they had a bouncing ball demo (bouncing all
over the screen) while they were doing DTP (Calamus SL), AND playing a game
behind it! I even saw the same screen having a 24bit graphics show!!
>
>If the Falcon could do multitasking, you'd be complaining about the
>"small" resolutions (ie, 640x480 with overscan) too. 1024x768 is much

Why is it so "appropriate"? Why not just have multiple windows, more or less,
on top of each other? Same results! I would think 768x428 would be ample space
for a program to display...

>* E-magic Notator 3.16 is exactly the same as C-Lab Notator 3.15, but with
> different packaging (perhaps without the alleged "hanging" bug).

>* The two people who hold the copyright to Notator have left C-Lab and
> taken Notator with them to E-magic.

I ordered an upgrade to 3.15 from Sound Technology (C-Lab distributers).
After some delay, I've received an Emagic 3.16, which works well on my
STE. It has Emagic rather than C-Lab on the logo screen, but the same
names (Lengeling/Adam) on the copyright.

I have noticed occasional hangs during initial loading with all versions
of Notator, including 3.16. These have only occurred since I started
using the Mark Williams Ramdisk (rde.prg) posted by wabe@ukc.ac.uk, so I
have written this off as a slight glitch that can be put up with.

My point in bringing that up was that you were comparing the Falcon with all its uses to a BASE IBM with _only_ graphics capabilities. If you want to compare two computers, you must compare ALL aspects.
About the sampler bit.. Personally, I'm not going to sample for just my listening pleasure!! I'm going to do serious work with it (music). So what you have 13M in samples?
>

Getting a little pissed, huh? ("_console_") Well don't flame if you can't take the heat...
>
[stuff eradicated]
>Actually, the '030/'386 and '040/'486 are much closer than the '000/'086
>ever was... A 16Mhz '030 is about the same as a 20Mhz '386.

What the hell's a 80086?? If you check your facts (I'm not even going to BOTHER arguing - the facts have been PROVEN), or read further back in this newsgroup, you will see that a 68030-33 will surpass the 80486-33... Therefore comparing the 68030-16 to a 80386-20 is not advisable. AND have you given any thought to the DSP?? This will boost the speed and power of the Falcon, making your comparison even more innapropriate. Refer to the post a little while back where someone compared a Falcon to a 486, where he shows how fast the Falcon really is...

>

Sounds like you need a TT,they're selling for less than $1300 nowadays. Just
like you said, a 32MHz, 32-bit, 68030 which can have up to (well more than
actually) 26 MB of RAM. Having used one extensively, I must say it's one
pretty darn fast computer, and I would say it _is_ great for general
purpose (not the 1280x960 high resolution if you want to do serious DTP or
whatever). Also, it's got the SCSI interface, VME slot for 24-bit color,
plus loads of professional software for it (take a look at the ads for
San Jose Computer, for example).

Overall, a nice, fast, functional machine.

>> PC clones! Ha! I get much better performance on my Cray!
>
>You can get a Cray for under $1000? Do they take MasterCard?

Errr, sarcasm alert! I think the original poster is trying to make a
point about the "more is better" argument so frequently used by Atari
dissidents in this newsgroup. Simply because a machine has a higher
clock speed/higher resolution/bigger _whatever_ doesn't automatically
make it a better computer in general. It all depends what you want to
do with it and whether the computer you have can suit your needs. If, say
all you do is word processing, what reason is there to get a 486dx/66 when
a 386dx/25 would do equally well? Not everyone needs the cutting edge
of technology sitting on their desk -- they just need something that can get
the job done (whatever that may be).

GER2EN21 does not work on the Falcon. It bombs after selecting a file.
Since it works fine on the TT, that rises some compatibility issues
about the Falcon ? If less programs run on it then on the TT, pretty
you'll be left with no programs to run.

Yes. Line-A works on the Falcon. I tried changing the Font by just changing the address of the font in Line-A and it worked. Lots of other things don't work anymore. So be careful. The best solution is to try the program.

Hi all. I am trying to hook up a Seagate SCSI drive to a BMS-100 host adaptor. The BMS manual only mentions the Adaptec4000 when discussing SCSI devices. No mention is made of SCSI embedded drives. Has anyone ever hooked up a SCSI drive to a BMS-100? Please help.

By the way, people are often looking for Adaptec4070 SCSI->RLL controllers so they can use IBM type RLL drives with their ST (also known as ST506 RLL drives). These boards are out of production, but I have one extra. Mail me if interested.

>> single-tasking downloading.
>
>xyz usually gives me ~234 CPS, STalker gives me ~232 CPS. That's about
>1k of data less every 9 minutes...

Which means that STalker is about 1% slower. Seeing as how you get to
actually USE your computer to do other things at the same time, this
seems to me to be a reasonable tradeoff.

Con: That 300K download takes an extra 11 seconds, taking 21 minutes,
33 seconds instead of 21 minutes, 22 seconds.

Pro: You got to use your computer to do something other than watching
XYZ's screen display for those 21 minutes, rather than twiddling your
thumbs for the whole time.

I'd count the "pro" as more important than the "con."

(Yes, you can probably find something better to do than "watch XYZ's
screen display" during those 21 minutes. However, it won't involve
using your ST.)

I can't get too excited about these schemes where people try to shave
off an extra 1%; that 1% tends to get lost in the "noise" of trying to
figure out which directory you're going to stick the file in. You can
usually find MUCH more than a 1% improvement by tweaking with things
like a) compression methods, b) new modem, or other such things.

There's also people who swear by YModem-G, which is a 1K version of
XModem which (I think) does no error recovery, does not send file
names around, uses shorter checksums than ZModem, and winds up
speeding transfer rates by MAYBE 2%. That 2% gets eaten away quickly
if you have to:
a) Re-download a file because there was an error, or
b) Figure out what the file name is supposed to be.

I'd rather go with the "simple" solution of just using Z-Modem.

That was just a rumor started by some of the more paranoid amoeba
owners 8-)

The original resolution spec's are what we are still getting!

(Some small changes, but no 'souping up')

In article <73642@cup.portal.com> Bob_BobR_Retelle@cup.portal.com writes sarcastically:
| Kos Petoussis writes:)
|
| >There are whole Worlds to disc-over and rule, enough for the rest of my
| >life. And I'm happy about it.
|
| >Please don't react.
| >I don't care.
|
| Well, I guess that's fine for you... once you finish Knightmare you can
| play it over and over again.. I guess you don't need any new games to
| satisfy you..
|
If this is the case, then why are you following up? Do you feel the need to prove what a great guy you are by taking the piss out of people who are (gasp!) HAPPY with the software they have?

| Meanwhile, Captive has just been ported to the PC, and I've got a huge
| backlog of games to play.. Might and Magic 1,2 and 3.. Ultima 1 through
| 7, and Ultima Underworld.. Wizardry, more versions than I can count..
| Eye of the Beholder III should be out soon.. the first and second games
| were terrific..
|
No they weren't, they were crap. I played both on Amigas and PCs, and Dungeon Master still has the better user interface.

|
| But I guess I don't have to bother telling you.. you're happy playing
| Dungeon Master over and over...
|
Well, Dungeon Master has worn a bit thin now... but Chaos Strikes back is still fun.

Does anyone have any solid info on the Atari Jaguar?
With the advent of the 3DO and dominance of Sega/nintendo in the
home-console market, does it stand a chance?

If anyone does have info on it, please post it or even e-mail it to
me and I'll summarize to the net.

i really think the viability of Atari really depends on its cash flow
from the Lynx and Game systems, the Falcon/St/TT series computers are
not going to produce alot of money for the folx in Sunnyvale.

1087. Re: ADVOCACY: Re: PC VS ST

Source record: 211827

Just to clear up a point.....

A 68030 chip, is a 32-bit processor with onboard instruction caching
(if the same instruction is called soon after, it won't be re-processed,
saving alot of time)

the 80386SX (the 'standard') is also a 32-bit processor, but only
has a 16-bit external data Bus. So, the 030 does what the 386 does
in one cycle, instead of 2!

So, to get an IBM compat' running at the same speed of the falcon,
you'd need a machine running somewhere around 32Mhz, running a 386DX
processor (80386DX).

Difference in speed is because MS-DOS is (not hacking at it's users)
functionally slow, so are most BIOS's, and most of the assorted
internal architecture doesn't help either. Add to that the slow
speed of many of the graphics cards (some are better than others),
and it can make a big speed difference!

a motorola chip is more powerful than it's equivalent in speed on
the IBM compat's! (okay, a 68000 at 16Mhz is obviously going to be
beaten by a 16Mhz 386 - but take *current* chips, and you should
be okay 8-)

Remember, I don't care which machine wins, as long as the information
is a *bit* more correct ;-)

> are compilers, text editors and games.

Lets see, you need a VGA video card (standard). A Soundblaster,
(to get closer to the Falcon's sound quality). (Pro' version, at approx'
$250-$300). SCSI-2 interface, unknown price. Operating System,
(MS-DOS, usually bundled, otherwise usually around $100 somewhere,
depending on where you get it from). DSP chip, a DSP board for the
IBM compat is not cheap. I'm not sure of the price, but I'm sure
someone can better inform of this. A friend showed me a brochure,
but I've forgotten the price he quoted.

It's not what the machine can do NOW, it's what it's capable of doing!

I think it's the 'board' they've 'botched up'.

The compatibility levels with existing STE software, is reported as being
around 90%. Although REALLY extensive tests have not been performed
yet - but soon!

They have not 'missed the boat'. Most people in this country have heard
of neither the A1200, or the Falcon. By March Atari might just make it!

Wait & see, and try to find some better information!

Do not use LDW-Basic! It is old(ish), and not supported!

If you want to use BASIC, then your best best is GFA-Basic. It's
probably the faSTest basic around for the ST. And it has a lot of
commands that you can use for chopping out sprites and bouncing them
around the screen/controling them etc.!

This of course, is probably not the news you wanted ;-) But, GFA
is probably one of the 4 most popular programming languages on the ST
(STOS, C, Assembler, and GFA Basic are probably the Biggest).

On this subject, is there a SHareware/PD implementation of PASCAL
(Yes, I know 8-) For the ST!?

Over here, (MPI fuer Zuechtungsforschung, Cologne), the ST:PC
ratio is 1:1 roughly. Ataris are used for word processing and DTP
purposes mostly, currently I am the only one who actually works
on programming. And as I'm one of the guys people call in case of
computer problems, I know PCs cause much more trouble than STs.
To me, that's a strong reason to advice people to go Atari.

Just another data point...

1094. STalker Zmodem downloads

Newsgroup: comp.sys.atari.st
Date: 1993-01-17 01:24:38 UTC
From: bgilbert@cs.washington.edu
Message-ID: <1993Jan17.012438.24887@beaver.cs.washington.edu>
Source record: 211834

All this talk about STalker (which is great IMHO) has brought up the following question I've been wondering about : does STalker do Zmodem recovery? Sometimes when a file is only partially tranferred it would be nice not to have to re-transfer the part I already have (I've done this before on an MS-DOS machine with Telix).

I've set STalker to keep the aborted downloads, but does it ever recognize that part of the file is there and just start appending it?

Regards,

Umm.. not unless Steve Jobs' influence is a lot more pervasive
than any of us suspect..

The same kind of RS-422 connections are used on DECservers,
Emulex Terminal servers, and a lot of professional equipment.
CTS/RTS, RI, CD and all the other "missing" RS-232 signals
are of little or no use in many communications applications, and
are just expensive overkill as far as connectors and cables go..

For modem applications, RS-232 is probably the best way to go,
unless perhaps the Apple system works without needing hardware
handshaking..?

Factories usually produce more than one thing. Previously the factory
probably worked well, and that's why Atari used it. Problems with
the Falcon, are the factories fault then, Atari aren't running it.

It happens to some extent, quite often!

[This really belongs elsewhere but it's so nice to see a real thread
here I thought I'd join in :-)]

Interestingly enough..... in order to use a high speed (v42bis (?)) modem
on a Mac you need a special cable that implements hardware handshaking
(Costs more than the standard Mac modem cable also). Found that out
when we purchased a few here for testing and somebody wanted one of
these test modems to work on his Mac.

I agree completly. Nearly all games won't work off a Hard Drive on
the ST, and a lot of them make you switch screen resolutions on the
ST before you start them - which is a pain because it means resetting
the computer. I tried about 10 new games the other day,about 1 worked!!!

It's sooo depressing to have to copy them to floppy and try all sorts
of modes etc to find out how to get them to go.

I should note that Dave Badgett's (sp?) games are an exception to this
rule - they install on the HD just fine.

Source record: 211846

Well, probably no surprise.. my favorite genre of games is RPGs.

Dungeon Master is still the best example of them, and of course Chaos Strikes Back.

Bloodwych I and II were good too.. and Captive and Knightmare are both excellent (some day I've got to finish both..!)

I too have been hearing good things about AmberStar.. I'd get it, but I really don't have time to start a new one.. (that was the reason I held off getting Knightmare originally.. and I've still got EOB II to finish on my PC, and one other one I'm beta-testing). I hate to get a game and just put it on the shelf.. it's too tempting to sneak it down and load it, "just to take a look"...

Oh yes.. and Omega..! One of the best features of that game is the ability to "play yourself".. most games have you make up a fantasy character.. a Fighter or Wizard or whatever, with imaginary strengths and weaknesses...

Omega however lets you enter information about yourself.. your skills and weaknesses, and physical information like height and weight, and it generates a character based on your input.. so if you tell the truth, you end up playing a character which actually represents how you would fare in the fantasy situation..

It's an ASCII based graphical game... no fancy pictures, but still a lot of fun..!

There is a FAQ about Motorola vs. Intel comparisons posted in one of the
Mac newsgroups (comp.sys.mac.hardware), and here is what it says about
clock frequencies...

From: Grubb
To: All
Subject: Mac & IBM Info-Version 1.0
Created: Fri 01 Jan 93 at 15:15

Mac & IBM Info-Version 1.0

The reason for this general data sheet is that people in both camps are
not
clear or accurate about what they are saying about their machines. When
completed, this data sheet will, I hope, enable us to make convincing and
intelligent comparisons between Mac and IBM. To help keep this organized
please provide, if possible, article citations for the information
provided or
corrected. Also keep it simple so I can understand what is being talked
about.
Since this is a data sheet let's keep the opinions to a minimum. Also,
give
me the info to make it complete as opposed to just saying it is incomplete

and keep the information relevant to the section corrected. {For example,
OS
code in ROM is hardware and not software, so no more of the 'but it is
supported in OS software' data for the hardware section, please.}
Thank you.

[... lots of interesting stuff deleted for brevity...]

CPUs comparison List:
As a general rule of thumb Motorola chips are faster then Intel chips at
the
same frequency {040/25 ~= 486/33}, but Intel has chips at higher
frequencies
then Motorola, so this evens out. The Macintosh Bible 4th ed. supports

the
comparisons between Intel and Motorola chips for the 68020 and above.

~~~~~~~~~~

(The entire FAQ is much longer, of course.)

If this applies equally to the 80386 and 68030, with the Motorola chip being a third faster at the same clock speed, then a 16 MHz 68030 would equal approximately a 22 MHz 80386. Taking considerations other than pure CPU speed into account, I would guess that a 33 MHz 386-based machine would be faster than a 16 MHz 68030.

In less than a month, there'll be the LC III, with better graphics (8 bit on 16-inch monitor, which means more than 640*480), full 32-bit databus, 25 MHz 68030, 4 MB of RAM (expandable to 36)... and all that for less than $1500.

DO> 040 and several 486sx's.
DO> The 040 running at '25 MHz just beat the '486 running at 50Hz,
DO> and was something like double the practical speed of a '486
DO> running at 33MHz!

That is not surprising. It all depends on the marketing hype used by Intel
A "50 MHz" 486DX2 runs internally at 50 MHz, while the clock speed for
the rest of the system is 25 MHz. On the other hand, a 25 MHz 68040 runs
internally at 50 MHz also... there are apparently 486DX3 chips in the
pipeline, which will run at thrice the external clock speed (i.e. 75 MHz
in stead of 50 MHz, and 99 MHz in stead of 66 MHz).

DO> Once we get an '040 Falcon, then we can take on the big league
DO> with better than equal equipment!

I wonder whether we'll see an 040 Falcon this millenium... there are new,
cheaper 040 Macs coming out (the Centris line, with the 25 MHz version
with 230 megabyte harddisk at about $2900). Perhaps Atari can beat that
price, eventually, but the Centris will available next month...

DO> I suspect that an '030 is significantly better than a '386
DO> and a '386 with a DSP board doesnt count 'cause nothing would
DO> use it! Compare the Falcon to a like-specced '486...

And the 486 is likely to be cheaper. By the time the Falcon is available
in large quantities, the 486 will definitely be cheaper.

If you get the excellent (external) program XYZ 2.01, you can use it to do zmodem in Flash by pressing one key. I use it constantly. Why add 10 protocols to every term program, it just makes the program bigger and more expensive (and potentially buggier!). Using external file transfer progs makes a lot of sense - also you don't have to change the term program to add protocols or fix bugs in them.

> (And please, please please NEVER brag about such
> things as "super powerful scripting capabilities using a C-like
> language"

Hear hear. I use Flash a lot and never use the script files. Don't care about that at all. Unfortunately the new prog Storm seems to take this feature to ridiculous extremes by adding a Basic interpreter to the damn program (gag).

>
>I'd like to be able to reset without the modem hanging up...
>
There is a hardware trick you can do, which I've been using with my
1040STf (I'm sure it has TOS 1.2). If you toggle the state of the
monitor sense pin in the monitor connector the ST reboots without
disconnecting the modem (I think it disconnects by turning the DTR
off during reset). Since I have a multisync monitor connected to my
ST with a homemade switch box, this is easy for me to do.

The other thing you might do is to set your modem to ignore the state of
DTR. In my modem, a Multitech, which is Hayes compatible, switch 1 in the 8-
sition switch is used to force DTR on at all times.

>(BTW, Dan.. yes, we're VERY lucky here in Michigan that we still have
>TWO whole Atari dealers to choose from.. some states don't have ANY..)

From what I've read that seems to be true in some instances. Some of the posts I have seen would lead one to believe there are many major metropolitan areas without an Atari dealer. Is this true?

>(Care to try counting all the PC and Mac dealers in the same area..??)

Not counting Sears, Fretter, Highland, etc. (the appliance type stores); not nearly as many as there used to be even a few years ago. That, however, does not matter. What does matter is this:

1. Atari does very little (I didn't say none) advertising outside of Atari specific magazines. IBM and Apple do.

2. Even if there is not an "IBM" or "Apple" store near you, one need look no farther than the nearest appliance store or regional shopping mall to find hardware and software for these machines. It really doesn't matter to most (again, I didn't say all) computer buyers that the salesperson doesn't have a clue if the equipment manufacturer has created a desire for the product by advertising and has made it reasonably easy to at least start using.

Atari cannot hope to spend the amounts for advertising that IBM and Apple have available. Don't look for it--you ain't gonna see it. What they can do is to try and get some product onto the shelves of such places as appliance stores, Sears, computer superstores, etc. Both hardware and software would have to be available. This is what is really killing Atari. Is there anyone reading this who truly does not know where to buy Atari products from? (I didn't say Falcons) Is there anyone who doesn't read this newsgroup or CIS, GEnie, etc. or who doesn't already own an Atari who does know where to buy one? My guess is probably not in both cases.

Perhaps Atari can succeed in the quest to do these kinds of things. Perhaps they simply are not capable of it. We'll see.

Say what? You just said that a 386_SX_ is 16 bit external. True. Now you compare it to a 68030 on a 16 bit bus (falcon) and claim the falcon is twice as fast. Then you both double the clock speed of the 386 (to 32 MHz) and change the 386_SX_ to a 386_DX_ (which is 32 bit external) and now say that the falcon and the 32MHz 386DX are equivalent. Sorry. I just don't follow you. The conclusion may be right, but the reasoning seems inconsistent.

Source record: 211754
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Howdy folks... Any overscan users out here? I just have a coupla questions.

Is it worth the trouble? Basically the answer to this is a function of the number of programs that will take advantage of it.

Would stalker, rufus, and/or connect take advantage of it? How about uniterm?

How about Spectre... would I get the extra Rez in Mac mode?

Basically I would like to be able to get more data on my screen at once.

There is lots of dead space on my SM124, so it would seem that this modification, would give me many more lines/columns of text.... is this true....

Note: I am a monochrome monitor user (SM124)....

Also I have an old 1040STf... I do not have the new TOS 1.4, will this be a problem..?

thanks..... .....Chris

ER> are definitely worth the effort!

I had the same thing also. I hated GEM and thought it was horribly slow but
some time ago I decided at really was time to get to grips with GEM, with
MultiTOS coming and all, and it really is great.
I still don't like VDI very much but I use it nonetheless for compatibility
reasons. I have found that some smart tricks involving clipping (using it
as little as possible!) can really speed text output up.
And AES is really very nice, it doesn't have a lot of calls but it has just
the right ones and I've even managed to put dialogs with edit-objects in
windows and it looks really nifty!

Hi Stephan!

p>Does TOS 2.05 work in a 1040STf?

TOS 2.05 does NOT work in a 1040STF. To have a 2.0x TOS in an old ST, you will need TOS 2.06, which came shortly after 2.05. The Problem with 2.05 was that it is bigger than the old 192 kb versions. So ATARI did two things. 1) The TOS start address was moved from $fc0000 (TOS 1.x) to $e00000 (2.x, 3.x). So with TOS 2.05 a 1040 woluld get confused about where to find the TOS. TOS 2.06 finds out on which type of machine it is running and manages address room conversion accordingly. 2) TOS 2.05 and above won't fit into the old type of ROM chips, so ATARI used bigger ones. To put these into a 1040 you need an adapter board, which also contains some logic for address room managing (I think that the 1040 STE has already the bigger sockets). Here in Germany there are several sources to buy such adapter boards (about 160,- DM or 100 $), but I don't know about any supplier outside Germany.

Anyway, there are ways to get an older ST work with TOS 2.06, but I think it's not worth upgrading for 100 $. I'm using GEMINI instead (under TOS 1.04), which provides most of the new Desktop features and more. For me, upgrading would mean to buy a newer machine (MSTE or TT) to get more than just a new TOS. (But this is certainly a matter of personal taste :-)

Hope this helps

Andreas

I wasn't talking about desk-accessories, and i'm definetly not alone
in experiencing this problem.

Simply put, _some_ programs will not run on the first double click, they
bring up the alert box with show/print/cancel. It's only on certain
programs, they almost always do it, and choosing cancel and double
clicking on them again usually gets them going (sometimes it takes
another cancel I think)).

I think this is appropriate in this newsgroup at this stage,
the authors name is at the end of it.

To: All
Subject: The Bulletin Board

I purchased a modem with comsumate glee,
to allow other users to commune with me.
Less than an hour it took me to find,
That most users were one of a kind.

Nerds and hackers and Gurus too,
all vying to log-on and state their view.
Outdoing each other as to how much they know,
on system designing and system flow.

Comparing their system with that of another,
And fighting like children I'm sad to discover.
The system THEY chose is always the best,
Yours will have failed the such and such test.

Fighting with someone who's only a name,
The theme of the arguements always the same.
The machine you've chosen, you thought was a must,
is out of production or the dealer's gone bust.

You should have consulted them long before this,
they could have told you to give that one a miss.
If only you'd listen to expert advice,
To buy bigger and better at a third the price.

Argueing under the guise of debate,
on systems and software and modem baud rate,
detaching myself for a broad overview,
I conclude that these actions apply to me too.

Nonerd
(Peter Rogerson)

1130. Falcon screen resolutions (ADVOCACY? Who knows?)

Newsgroup: comp.sys.atari.st
Date: 1993-01-17 12:42:38 UTC
From: sjg@phlim.ph.kcl.ac.uk
Message-ID: <1993Jan17.124238.26567@sol.ctr.columbia.edu>
Source record: 211770

>Not even close, without ScreenBlaster. These days, everyone has a 1M
>video card... they almost all do 1024x768x256 colours. Many of them can
>do nice modes like 320x200x32000...

Does anyone actually use 1024x768 on the 14" monitors that everyone
seems to have on their PC's ? I had to use a PC at this res and after
30 mins I switched it down to 800x600. (Still bigger than the Falcon,
but not *that* much). I found I missed the increased res a bit, but
being able to read what was on the screen was well worth it :-)
This was on an AOC monitor, non-interlaced at 1024x768, and quite a
respected monitor in its own right.

I think you need a 17" monitor to do 1024x768 (although 17" will cope
with 1280x1024, just). The main problem I see is that these things are
incredibly expensive. Over here in the UK we pay something like
(brings out Computer Shopper) 600 -> 1400 pounds RRP, (with the
street price being less at the high end, but not by much).

My point is that although PC's can do this high a resolution, it's
wasted if it's not used. Still, it's nice to know it's there if you
ever splash out on a high res screen.

Simon.

1131. Some realism in the flame wars, please!

Newsgroup: comp.sys.atari.st
Date: 1993-01-17 13:31:36 UTC
From: oscar@contrast.wlink.nl
Message-ID: <727299604.AA01101@contrast.wlink.nl>
Source record: 211797

Hi boris,

Up till now, I've been a lurker, trying not to get involved in anything sticky. But OK, the flesh is weaker than the will...

b> It (Falcon) will be shipping in quantity by march. NOT atari's fault.

How many Atari-lies are you going to accept?

b> The ONLY reason for the PC continuing to exist is no one is
b> willing to admit they got sucking and taken to the cleaners.

b> you can't compare the two machines. The moment you load any
b> software into a PC it slows down! It never does on an ST.

And so on....

Look. I was a Atari-zealot like yourself until a few months ago. I was forced to buy a 386/40 for a programming project, so I started to use it with the same ideas you still seem to have.

Fact is, a US $1500 clone will run Unix with X quite acceptably (it does that right here, in fact). It buries the ST and the Falcon (yes, I saw them/tried them) in speed and graphics, *even under Windows*. Accept it. It's a fact. Defend the Atari machines on their true merits, not on dogmatism. There is more to computing than speed and resolution.

That is my point: I *know* the Atari is rather slow compared to the competition. I know, because I had an ST and a Mac II and a 386/40 sitting together on my (creaking) desk. Why do ST people keep on telling that 386 clones are slow? They aren't. Speedwise, they will make the Falcon look not-so-good. Move the flame wars to another point, please.

(... the Falcon ...)
b> with no more additional software than a cheap modem. It
b> does TRUE multi-tasking unlike the PC and amiga which
b> time-shares.

Did you ever *see* OS/2? It is 'true' multitasking, just as all the PC-Unixes. Besides, cooperative multitasking is all a Quadra 950 manages to do right now. If done well it is not such a problem for the average user.

b> To those about to rant at me:
b> Take it somewhere else. I really hate whinners.

Oh, yes, me too! Awful.... :-)

b> Pc users go and stick to your own sigs too. Put up or shut
b> up.

And so, I will retreat in my former lurking position, quietly reading comp.sys.atari.st, getting some good facts, and some uninformed opinions. Just, please, inform yourself on the facts: clones are not quite what they were three years ago.

Groeten,

Oscar

b> cheap modem. It does TRUE multi-tasking unlike the PC and amiga which
b> time-shares.

Hi Boris,

I'm a great fan of Atari too, you could even call me an Atari chearleader,
I don't care, but what do you mean by saying the Falcon does TRUE
multitasking an the Pc and amiga only time-share? The Falcon also only has
1 CPU, so what are you talking about? The difference between pre-empritve
and cooperative multitasking? Thank god MultiTOS is pre-emptive. I work
quite alot with Mac's (Multifinder & System 7) and everything goes nice and
well until you run some program that doesn't give other
processes any time. Goodbye "multitasking"!
And they don't even decent inter-process-communication. MultiTOS has lots
of those features, even old TOS had them (appl_write/appl_read)

Ta!

>A 68030 chip, is a 32-bit processor with onboard instruction caching
>(if the same instruction is called soon after, it won't be re-processed,
>saving alot of time)

Not quite. Processor won't have to waste time doing a bus access to
get the line of memory that the instruction it's in (since it's
already in cache), but, of course, it will have to get processed again
(i.e., decoded and executed).

>the 80386SX (the 'standard') is also a 32-bit processor, but only
>has a 16-bit external data Bus. So, the 030 does what the 386 does
>in one cycle, instead of 2!

Well, that's true for 32-bit word access assuming that the 68030 has a
32-bit bus hanging off it. The 68030 has this nifty feature that
allows it to use a 8, 16 or 32 bit and it appears that Atari has
chosen a 16-bit bus (however, the concensus seems to be that the
graphics sub-system has 32-bit access), so for the Falcon there is no
advantage over a 386SX in this respect.

>So, to get an IBM compat' running at the same speed of the falcon,
>you'd need a machine running somewhere around 32Mhz, running a 386DX
>processor (80386DX).

I have no idea where you get 32Mhz from. I suppose if you took some
portable applications, compiled them for both machines and determined
the average CPI (cycles per instruction), you might be able to come
up with something remotely conclusive. However, there are more factors
than just processor speed in determining overall throughput. (Thank
you, Hennessy and Patterson!)

If you had been following the news, Bob Brodie I believe recently said
on Genie that they've been having production line problems in the
Far East. Atari hires factories to make this stuff, they don't make 'em
in Sunnyvale! Brodie said the reject rate was way too high. So if they're
shipping 800, they probably made several thousand, many of which failed
diagnostics.

I just pop the cover off my Mega 4 STe and insert a 68881 co-processor and
away we go! The socket for it already exists.

Yes, thats why a responsible company has more then one vendor, it's called
multi sourcing. There are times when you have to single source, like say
with Micro processors (Then again the vendor will have multiple wafer
sites producing the chips), but never, ever single source the only
product that might save your company.

To me it's just more of the same Atari B.S.

I was wondering if any of you could help me. My Interlink program crashed, and for some reason it is not loading up the vt100 emulator. If anyone out there knows what is going on, or better yet, has Interlink that they could E-mail me, I would really appreciate it. I am also looking for a better com program if that would solve my problem. Thanks,

garath@panix.com

>being able to read what was on the screen was well worth it :-)
>This was on an AOC monitor, non-interlaced at 1024x768, and quite a
>respected monitor in its own right.

I used 1024x768 for quite a long time before I moved to a nicer system. For X-Windows under AIX I found that 1024x768 was tolerable. I was limited to 256 colors, but I certainly didn't see a performance decrease. That resolution is a bit limiting for windows.

When I moved to a 1280x1024 Image Adapter/A for the 6091 19" monitor for my PS/2 model 80, I was much more impressed. I still had only 256 colors, but the resolution was great. I could display four 80x25 screens with a 10 point font and view them all. The Image Adapter/A was even faster than the 8514/A adapter.

By the way, I have noticed that few people actually refer to IBM hardare but many people call the hardware IBM.

>
>I think you need a 17" monitor to do 1024x768 (although 17" will cope
>with 1280x1024, just). The main problem I see is that these things are
>incredibly expensive. Over here in the UK we pay something like
>(brings out Computer Shopper) 600 -> 1400 pounds RRP, (with the
>street price being less at the high end, but not by much).

The Image Adapter/A with 3Mb of memory was $3000 list price (I don't know how much people actually pay for it, but I believe that the department I worked for paid about $300 for it). Also the 6091 19" monitor was also quite expensive, I think it had a list price of $2000. So for about the price of a low end Volkswagon, I could have purchased these two devices.

>
>My point is that although PC's can do this high a resolution, it's
>wasted if it's not used. Still, it's nice to know it's there if you
>ever splash out on a high res screen.

You really need an operating system on a computer to always use the high resolution of the screen. I consider an operating system to be something like OS/2, AIX, UNIX, NT, and Linux. Under a non-operating sytem like DOS, each program has to be specially compiled to take advantage

of the screen. While DOS may have some device drivers for the screen, it
doesn't have the autoscaling features of other operating systems that had
windowing in mind (or at least a way to handle many different definitions
for the same device type) during their development.

Steve, you're wrong about 80 x 24 display with STalker, that's what I'm using right now with the standard screen font. You do it by getting rid of the scroll bars. (if you have a manual RTFM and you'll see how to do that, simple key stroke commands) You have to set the line length to 80 and then you have 80X 24. NICE, the best of both worlds, scroll bars when you want them, not when you don't. Eric is some kind of programmer!

Source record: 211798

Once again today I post that I am using 80 x 24 with the standard screen font on STalker 3, my comm. program of choice when not on GEnie. All you have to do is use the key stroke commands to get rid of the scroll bars and title bar and configure the display to 80 columns.

1159. Re: Stalker vs Uniterm!

> 256 colour modes.

Point? Please, please tell me you're going to do anything other than
looking at GIFs with it.

Those huge graphics modes are just as much "child's play" on a PC. Or
Mac. Or Amiga.

> [stuff eradicated]

ditto

> Because I've seen AND used one...Don't presume.

Wow, lucky you. Drop into DMC Publishing? I'd much rather have
Nathan's TT setup (20M of RAM and an amazing Cyrel SunRise graphics
board).

The point I have is that _most_ of us will never see a Falcon, let alone
use one. Toronto is probably the only place in Ontario that still has a
few stores carrying Atari equipment.

> Well, when I put memory into the computer, voila!, more memory goes into the
> graphics capability as well, whereas you have to upgrade both _separately_!

Gee, lets ignore the fact that systems with separate video memory are
much faster than systems stuck using the same RAM (that's why Macs, and
Amigas, and PCs, and everything else has separate VRAM).

> The "poor fool" doesn't have pathetic drivers, its just his computer's too
> slow to handle it. Windows at that rez will be mucho slow unless you have
> a 486-33 at least!

It's slow because of the idiot 8Mhz bus. Sending 768k of data over an
8- r 16-bit bus at 8Mhz is _slow_ when there's other things (like disk
and RAM access) having to drip through there as well.

If you were buying a system today, you'd be foolish not to buy a
LocalBus PC (if you were getting PC). They're only a bit more expensive
than a normal PC.

> Here we are comparing graphics capabilities, and then you
> suddenly jump to a 1bit system... Do you know WHY its running at 1bit
> (2 colours) ? Because if it was any higher, the system would be _extremely_

> slow!

It's running in monochrome because that's the best thing for DTP work.
It's running in monochrome because a 19" colour monitor is _expensive_.
It's running in monochrome because a colour card capable of 1600x1280 is
expensive.

It's a MicroChannel '486, only Windows makes it extremely slow.

> Oh and also, the comparison is lousy as monitors that size are out
> of consumer range (why do you think it's at "work")...

No they're not. $1000 isn't expensive if you need it... there are
several TT users on GEnie (that in itself is amazing) with the 1280x960
monochrome monitors. If I was buying a TT, I'd want to buy the
monochrome monitor.

> At a recent Atari show,
> I saw a 1800x1600(i think) screen on a TT running multitos and the screen
> refresh was incredible. In fact they had a bouncing ball demo (bouncing all
> over the screen) while they were doing DTP (Calamus SL), AND playing a game
> behind it! I even saw the same screen having a 24bit graphics show!!

That was because of the Cyrel SunRise card plugged into the back of the
TT. Separate video RAM in it. It was probably "just" 1024x768 or
1280x960 in 24-bits.

Do you have _any_ idea of how expensive the SunRise is? The last time I
heard, it was as much as a TT.

> Why is it so "appropriate"? Why not just have multiple windows, more or less,
> on top of each other? Same results! I would think 768x428 would be ample space
> for a program to display...

It's annoying to have the windows stacked on top of each other... Ask
anyone stuck using Windows on a VGA monitor (640x480x16). I (any many
other people) find it much easier to work in several applications at the
same time when they can see them all... you can also keep an eye on
those nasty apps that are likely to crash at any second.

It's not one program's display area, the more programs you have, the
more display you'll want... It's also faster if they're not
overlapped...

> hundreds of occurences on the IBM...

Lessee... Get out of memory when I use PageStream (well excuuuuuse me
for doing complex pages...). I used to get Out of Memory all the time
before I went to 4M... I can barely believe I surived as long as I did
with "only" 1M.

When I run out of memory on my PC, I make the swapfile larger. Or close
one of the open applications that I'm done with.

If you're still using DOS programs that aren't smart enough to use >
640k, you're stuck with some _bad_ software. Even free software (hmm,
everything compiled with the DOS version of GNU C) can use the
EMS/XMS/whateverthehell memory in PCs. Or, you could use OS/2, and
forget all about the 640k limit...

I guess you've never played with a Quadra then... We've got Q700s in
the computer store at U of Waterloo; courtesy of System 7, it feels
about as fast as my ST. Naturally, it'll crunch numbers faster, but it
doesn't feel any faster. I can just imagine sys 7 on slower macs... yikes!

> The 040 running at '25 MHz just beat the '486 running at 50Hz, and was something
> like double the practical speed of a '486 running at 33MHz!

Like they'd show the '040 going slower... ;-) The Motorola processors
are much nicer, but you can't buy a cheap '040 machine _anywhere_.
'486 machines are < $1000 these days.

> Once we get an '040 Falcon, then we can take on the big league with better than
> equal equipment!

But will Atari ever release an '040 machine? EVER? Before the
"Pentium" ('586) or 68060 are released?

It'd certainly be nice to see a Falcon040... It'd be real fast, and
have real nice sound and graphics. It'd also be $3000-$4000.

> Oh no, I'm in a flame-war! What have I done?

> you have 13M in samples?

Well, you know, that real popular sound card (maybe you've heard of it)
the "SoundBlaster" can sample... You just plug the output from your
stereo or whatever into it. Hmm, much like the Falcon.

Sure, it's not CD or DAT quality, but do I need that? No way. If I did
need it, I could get it.

> Getting a little pissed, huh? ("_console_") Well don't flame if you can't
> take the heat...

Don't enter the flames if you can't bring evidence (oh, wait, with
facts, it'd be a discussion)...

The Falcon030 is a console... I didn't call it a "game console"; you
can't put anything on top of it (like those game consoles), it's all one
piece... console. Touchy?

> [stuff eradicated]
> >Actually, the '030/'386 and '040/'486 are much closer than the '000/'086

> What the hell's a 80086?? If you check your facts (I'm not even going to
> BOTHER arguing - the facts have been PROVEN), or read further back in this
> newsgroup, you will see that a 68030-33 will surpass the 80486-33...

If you had a clue, you'd know what an 8086 is... the "800086". There
was even a little 80186. Did you know there was an 68008? All of this
is pretty irrelevent.

Any '486 will blow any '030 to shreds; it simply has too much processing
power for the '030. Any Motorola processor will beat any Intel
processor _at_the_same_clock_speed_. So what? Get a faster processor.

Nothing has been proven in this discussion/flamethread. Well, other
than the fact that most people refuse to believe that a PC might be
useful and fast.

> Therefore
> comparing the 68030-16 to a 80386-20 is not advisable.

Huh, why not? They'll give you about the same benchmark results.

> AND have you given
> any thought to the DSP?? This will boost the speed and power of the Falcon,
> making your comparison even more innapropriate.

Only if a program uses it. You can't use the DSP for DTP (unless you're
dealing with 24-bit images you want to filter or something). You can't
use the DSP to make your compiler run faster.

> Refer to the post a little
> while back where someone compared a Falcon to a 486, where he shows how fast
> the Falcon really is...

Look in comp.sys.atari.st.tech for Howard Chu's data-filled summary of
how the various video modes slow down the Falcon. The large modes (big
screen, big number of colours) made the Falcon run half as fast as in
the "small" modes. 16-bit video isn't going to slow down my ray-tracing
on a '486.

Well, there IS one in Dayton, OH as a matter of fact. "Rising Star
Computers" in Dayton. I don't have the phone #/address at the moment,
but I do believe they advertise in some ST magazines (like AE).

That's where I bought my MegaSTe (traded-up my 1040st), and probably
will be where I get a Falcon as well...

True.

I don't see any reason to "wait for the Falcon040". The approach I prefer
is to get a Falcon030 first, then the Falcon040 when it is released - after
all, you'll already have the SVGA monitor and HD for the 030 - then you
can move across to the 040 - and only have to make up for the $800 for the
base machine. Sell it for $400, and you've only lost $400. And since you
can afford a 68040 based machine, that $400 shouldn't be too much!

I don't see that as a problem, in fact, since most everyone has some kind of experience with BASIC (as opposed to a proprietary scripting language like Flash uses, or "C" programming like other terminal programs use), it's a lot easier to put together working scripts with a lot less hassle, and without the need to learn a new programming language...

You get what you pay for, I guess. The included GDOS font works
fine for monochrome. I get 80 * 24 all the time, scrolling faster than I
can read at 14,400. That's on a sm124.

>......It does background downloading!? So, it's
>not a major extra. You still have to wait for it, and it's slower than
>single-tasking downloading.

Huh? I don't know what you're doing wrong, but I get 1550 to 1650
cps in background zmodem, and maybe 10-20 cps better in the foreground.
After having used shadow for years, I can't stand not being able to
download in the background. With Stalker in the background, I can have
someone phone me and send me a file without doing a thing.

>Just for the record, how many people out there *do* have 9600bps and
>higher modems!?

Probably a lot more than you think, now the Supras are out.

1173. NEW PROGRAM -> Get and download remote FTP files in your sleep!

Newsgroup: comp.sys.atari.st
Date: 1993-01-18 00:08:43 UTC
From: stusoft@hardy.u.washington.edu
Message-ID: <1jcsebINN7u@shelley.u.washington.edu>
Source record: 211613

I have written a soon to be released FTP Manager that can dial, login,
call a remote FTP site, get a bunch of files, download them to your Atari,
and logout. It works with all unix hosts and the commands are slightly
configurable and will be increasingly so. The main program is a shell
that allows management of many sites and the files you want from them.
Files can be selected directly from the index, so you don't have to type
them into the shell. It communicates with a STalker BackTALK script which
impliments this in STalker..other scripts could be written for other modem
programs. Autologing, getting the remote files, and downloading are all
selectable, so you can just get some files if you're already loged in, or
just download a big batch of files.
The timing feature allows you to set the time and date that you
want it to impliment it. It uses a GEM interface and (if I can get a few
bugs out) will run as a desk accessory and in any resolution with at least
640 pixels across. I will post it on atari.archive.umich.edu as soon as I
feel it is good enough...very soon. I'm making it Shareware, so your
support would be appreciated. =)

I'm curious as to how many people would be interested in a program like this.
Any unanswered questions or comments are welcome.

Roger Sheppard asked:
>If you send hime copies of the manuals he will include those terminal modes,
>he did ask me for a VT220 manual and I posted that reply here...

>Can you help..??

Yes, I checked with our Terminals department, but all they have is the user's manual and the hardware manual for the VT220.. I need to get in touch with someone in Network Control to see if they have the programming manual Alan needs..

I told him I'd send him that info if I can get it, plus anything else on other terminals we use that I can dig up..

He did say though, that other terminal emulations are a lower priority to some of the other enhancements he's working on, like more downloading protocols..

Also, work on Storm is indefinately delayed, now that he has a real job which is taking up all his time for the moment.

> [calm discussion]

>you can get a complete PC system for less than
>the Falcon will cost you.

You can get a complete C64 system for less than the Falcon will cost you.

?

You CANNOT get all the features of a Falcon for the price of a Falcon.
A DSP board for a PC will cost you $$$'s, for example.

Now, you can argue that you may not "need" a DSP, but a raw comparison
of price, untempered by a comparison of the machines is meaningless.
Start discussing the qualities of the machine, and swear words like
"DOS", "TOSFIXx", etc inevitabley arise.

For this reason, I think it's POINTLESS to argue that DOS machines
are better than Atari machines in this newsgroup. Maybe for the
things <generic> YOU are doing, but what has that to do with ME?
I hate programming on DOS machines. You can't change that, because
you can't change my experiences. I doubt many DOS programmers would
even disagree that DOS programming can be a PAIN - they certainly
complain to me. But they too have their reasons (eg. larger user
base).

I'm really sick and tired of "you can get a complete PC system for less than
the Falcon will cost you". All that means is that you can get a 80x8y
processor machine with zGA graphics.

Warwick rambles:

Dave suggested the "ADVOCACY" subject prefix, and BobR delibrately
deleted it from the subject line.

Wake up, Warwick.. learn how the system operates..

No, maybe I better fill you in, so you don't go around spreading more
lies..

When an article is posted under a Subject line like
"Warwick is a weeie", any reply to that article will be posted under
"Re: Warwick is a weenie".. UNLESS you specifically edit the Subject
line.

Look around... half, or more of the replies to things in this newsgroup
DO NOT have "ADVOCACY" in their Subject lines.. does that mean that
everyone posting those replies deliberately *deleted* it..?

No.. it means they didn't ADD it.. (probably specifically to annoy you,
if you also sent them private E-Mail ordering them to use the word in
their postings, as you sent to me...)

Opinions are one thing, distortions are another.. but outright lies
are something else...

>Don't you think the "hacksaw" comment is a bit overstated? I'm fairly
>certain that you know perfectly well that any hammer and decently
>sharpened chisel will be sufficient for this purpose :-)

Heh.. nope..! Ask Bill and Pattie how they got the double sided drive
they added to their first 520STFM to fit..

(Actually it was a coping saw I brought over to their house, not a
hacksaw, to be perfectly accurate.. :)

A good tin snips is a prerequisite to doing an AERCO memory upgrade
in a 520ST, a "chip clipper" to remove the 68000 is needed to do most
of the accelerator upgraded if the CPU is soldered in, and a DEKA again
needs the hacksaw treatment..

A well equipped workshop is nice to have for "upgrading" STs..!

From: oyakea@warren1b.its.rpi.edu
Message-ID: <5+f3ayr@rpi.edu>
Source record: 211621

The 3D-O is a new consumer electronic device along the lines of
the CD-I and CDTV, with the the game playing features of a Sega Genesis.
Unfortunately for all the above parties mentioned it is much more
powerful <from CES reports> than any of the above.
It boasts of a 3d graphics processing engine and 3d graphics handling
routines such as image scaling and rotation.
The 3D-O company from what I heard used to be known as SMSG < San Mateo
Systems Group so I was told>, and is now a consortium of Electronic
Arts, Matsushita <Panasonic>, AT&T, Warner Brothers and some other
secondary share holders, EA being the big wigs in charge....
Any way this system is causing a stir in the console industry as it has
built in interconnectivity..somesort of modem thingy... i am told things
such as pay fo play will be available through phone or cable link..
and interactive tv shows will be available...
ATARI WATCH OUT ... they will soon realise that the Market they founded is
quickly losing its exclusivity (which they should have realised along time
ago)... The 3D-O has big bucks behind it... the only problem i see is its
$700.00 price tag. IT IS TOO EXPENSIVE AND I WILL HONESTLY ADMIT I CAN NOT
AFFORD. I DON'T KNOW IF I WILL HAVE A CLEAR CONSCIENCE EVEN IF I DID.
HOWEVER I MUST ADMIT IT SOUNDS NICE NICE NICE.....

> What's the diggs on OS/2? If you have a system that can handle it comforta
> what will it do for you?

In addition to what Chris posted, one of the best things going for OS/2
is that it uses a "flat memory model" just like the ST..

That is, no more "640K limitation" and no more "extended/expanded" memory
management problems.

Effectively, OS/2 elmiminates one of the last things anyone can point
to and say "PCs suck compared to STs".

>
> A 68030 chip, is a 32-bit processor with onboard instruction caching
> (if the same instruction is called soon after, it won't be re-processed,
> saving alot of time)

ALL current CISC processors ('030, '040, '386, '486) have onboard caches. The '486s is a tiny 8k, which is why most motherboards have 64k, 128k or 256k of SRAM cache in addition to the on-chip cache.

> the 80386SX (the 'standard') is also a 32-bit processor, but only
> has a 16-bit external data Bus. So, the 030 does what the 386 does
> in one cycle, instead of 2!

Uh, the '030 in the Falcon is chained to a 16-bit bus, exactly the reason a '386sx is so slow. Most PCs (ie, the "standard") have '386s with a full 32-bit data path ("386dx" is what marketroids call it; the original chip).

The '386 does some instructions faster than the '030, and the '030 does some instructions faster than the '386 does. A 32-bit processor on a 32-bit bus does most things faster than a 32-bit processor stuck on a 16-bit bus.

> So, to get an IBM compat' running at the same speed of the falcon,
> you'd need a machine running somewhere around 32Mhz, running a 386DX
> processor (80386DX).

No you don't. '386sx/20 will be about as fast as the Falcon. However, in today's market, a '386dx/40 or a '486sx/25 is cheap enough for someone to buy... a '386sx/20 is going to be _cheap_... About as much as an ST is worth these days.

> Difference in speed is because MS-DOS is (not hacking at it's users)
> functionally slow, so are most BIOS's, and most of the assorted
> internal architecture doesn't help either. Add to that the slow
> speed of many of the graphics cards (some are better than others),
> and it can make a big speed difference!

Add Windows, and it makes things even worse!

However, buy a nice 32-bit machine, with a nice LocalBus video card...

> Remember, I don't care which machine wins, as long as the information
> is a *bit* more correct ;-)

Then you might want to do a bit more research... I think most of the
above is "Intel's designs are terrible! Why would anyone use that
instead of Motorola?!?!?" Intel isn't _that_ bad; their chips are
definitely getting better, and closer to the Motorola equivalents. It's
not like you should be programming them in assembly these days (or
need to, for that matter)...

The user interface in Eye of the Beholder is virtually identical to
Dungeon Master. It appears that Westwood copied it almost intact from
DM.. the only significant difference is in the magic system.

Playing EOB was like playing an extension of the Dungeon Master world.
The few differences were easy to get used to, much like Bloodwych and
Captive/Knightmare were virtual copies of the DM user interface.

1188. Re: A real computer question (old 520 ST)

Newsgroup: comp.sys.atari.st
Date: 1993-01-18 01:20:01 UTC
From: Bob_BobR_Retelle@cup.portal.com
Message-ID: <73783@cup.portal.com>
Source record: 211628

Kevin Klasmeier asked about floppy problems on a 520ST...

The problem (not accessing the floppy at all) could be a dead floppy
controller chip (which unfortunately is almost certain to be soldered
in place), or a dead sound chip (the ST uses the sound chip as part of
the floppy control circuit).

The early STs had problems with "chip creep" where the chips in sockets
tended to come loose with time.. you might want to try opening
the case and pressing all the socketed chips back down firmly.

Loose TOS ROMs can cause various problems, including the one
you described...

> ... like to give it to my younger bother to run video games ...
^^^^^^

(yeah.. I used to feel that way about mine too..! :)

>You CANNOT get all the features of a Falcon for the price of a Falcon.
>A DSP board for a PC will cost you $$$'s, for example.

Go find out how much an equivalent DSP board (*competitively priced*)
and tell us all how much it would be. Don't waste our time unless
you've done your homework.

>Now, you can argue that you may not "need" a DSP, but a raw comparison
>of price, untempered by a comparison of the machines is meaningless.
>Start discussing the qualities of the machine, and swear words like
>"DOS", "TOSFIXx", etc inevitabley arise.

I want to compile real fast, and that's about it. Other people want to
DTP real fast. Still others want to CAD real fast. The DSP would help
the CAD, but not many of the other common applications.

Curse Atari for putting the stupid DSP on there anyway -- they don't
need a singal processor in that box, they need a graphics processor!
Why can't they make a machine fast enough to drive its own graphics
well? If I'm going to get a computer like a Falcon, it'll be to play
and write games; I mean that's what the whiz-bang graphics and sound
capabilities are really for, of course. (Oh, excuse me, I should have
said "multimedia.") You ain't gonna see Sonic the Hedgehog running on
a Falcon.

>For this reason, I think it's POINTLESS to argue that DOS machines
>are better than Atari machines in this newsgroup.

Better? You're right, that's silly. But "more for the money --" now
that's more reasonable, and happens to be true as far as I can tell.

>I hate programming on DOS machines.

There are software strategies like huge pointers that make the machine
act like a flat memory model like the ST is, and given that, and since
you do all your programming in C++, what's the big deal? Are you going
to be grubbing around writing graphics routines? If so, then don't
bother; you can get perfectly fab prefab code for any graphics mode you
might ever want to use. (Case in point: Abrash's Mode X code in Dr.
Dobb's Journal)

For your own use (and you don't mention using the ST for anything
else), why not put the 386/486 in protected mode and write code just
like on the ST, for that matter? Nothing says you have to restrict
yourself to 8086 compatible code -- the GCC port for the PC in fact
makes executables that can address the full address space without any

hackery at all. What aspect of the PC would make writing STrabble so much harder? I mean, it's just HLL code, not assembly.

>I'm really sick and tired of "you can get a complete PC system for less than
>the Falcon will cost you". All that means is that you can get a 80x8y
>processor machine with zGA graphics.

I can understand why you're sick of hearing it. The truth of the statement means the eventual demise of your favorite machine(s), and that's a hard pill to swallow. The ST/TT/Falcon *were* a lot of fun to program, and the 68000 series are much more enjoyable to grub around with than the Intel chips, I'll be the first to admit. But eventually you have to face the fact that the underlying architecture is only one small piece of the big puzzle; software availability, strength of market, expandability, etc. are all major wins for the PC relative to the ST. And you simply don't know what's out there if you think a PC clone with graphics capabilities equivalent to the Falcon's will cost you more than a Falcon. Keep in mind that the prices quoted for the Falcon have been sans monitor. That's an additional $500 for a good one, a cost that's usually folded into PC clone prices nowadays.

Before you go to any extremes, try opening the CPU case, remove the
rf shields, and push all the socketed chips back into their sockets.
(Make sure you discharge any static buildup you may be carrying first...)
You'd be surprised how many of those older machines can be repaired
simply by "re-seating" the socketed chips. Especially the square
chips.

>CompuServe, you can send each other e-mail for free, no?

It'll never be completely free; they're not in business to give people services for free.

There is SOME charge for ALL e-mail, it's just that with GEnie, they have extra levels of charges for mail that goes outside GEnie.

On CI$, the recipient of email ALWAYS pays for mail (based on the connect time involved, I presume?), no matter whether the mail came from CI$, or from the InterNet.

It certainly does make the Freenet idea look more and more attractive!

>Take a look at the libraries (I thought you had?).

MiNT's an awesome hack, but in its current form it *is* pretty much a toy, especially on a stock ST. E.g., is there an X server that runs under MiNT? You can get 386 MACH (with X at 1280x1000x256 on a standard multisync monitor), and that includes a Berkeley Unix server as well as a DOS server. It must be pretty neato running Microsoft Flight Simulator in a window under MACH, with a Unix server to boot (so to speak). (I've never tried the DOS server myself, but I've read the docs for it, and they claim Flight Simulator runs fine. Impressive.)

Once you're running Unix, what difference does it make what the underlying CPU is? If you're intending for your stuff to be portable you shouldn't be relying on things like byte ordering anyway, and how many people really want to write Unix assembly language programs? And on the 386 and higher, Unixes behave normally with respect to memory -- no software hackery to get around the 8086 segment crap.

All your favorite GNU stuff runs under 386 MACH. And TeX, and X, and all the good C shells (my personal favorite, Zsh, compiled and ran without incident).

(Don't get me wrong -- I think MiNT is extremely well done.)

Source record: 211635

I have to give a great thank-you to all of the people that have been kindly adjusting their article titles so that it is easy to kill STuff written on the "Advocacy" topic that tends towards flamage.

I guess that Dave Baggett is one of those that is to be thanked for helping to encourage this (and I intend NO sarcasm here). I've tried to email you a couple of times, Dave, but my mailer keeps choking.

I would give a further "root" for this, and strongly suggest that to everyone following up a post that you spend 10 seconds making sure that the subject relates to the posting. That's another way of ensuring that it is easy to sort between "flames" and the kernels of useful information. As well, some subjects aren't of interest to all, flame or not.

Thanks.

Works fine for me! It doesn't screw up the CPS display either (some
zmodems count the recovered bytes as throughput... you end up with 900
CPS on a 2400 baud line!)... Quite nice! Somebody always seems to pick
up the phone when I'm half-way through a 300-500k file... ;-)

Well, a really way-cool 486 system runs about $2500, and this will give you
a LocalBus 66 MHz half-an SGI IRIS at integer math but blows chunks at
floating point wonderbox. Now let's all pretend for the moment that
Microsoft Windows does not exist (I know, hard as it's so big and ugly
but try)... Are PCs still a pain to program under Linux or OS/2 and
if so, what's painful about them that isn't a pain on an ST?

It really seems like LocalBus has removed most of my objections to PC graphics so inform me as to what remains wrong with the PC other than Bill "Satan Lives" Gates...

I can only think of one problem: the sound still sucks...

Next point, if a DSP board can be stuck into the LocalBus interface, then it wouldn't need a big buffer anymore, would it? Wouldn't this make it a lot cheaper? Perhaps even truly affordable? LocalBus runs at 33MHz, that's both faster than the DSP and the Falcon...

Correct me if I'm wrong, really...

Scott

OS/2> of MONEY, if you couldn't figure that out...)

How does this bit of reasoning still survive??? I invite you to visit your
neighborhood Mac seller. They are definitely competetive with Atari in
the price department. You can get a full blown Mac LCII with color monitor
4 megs of RAM, 80 meg hard disk for approximately $1600-1700 in New York
City. Even if the street price of a Falcon comes in a little lower with
a similar configuration (which is not very likely) how many people do you
think would buy an Atari to save a hundred bucks (or less)? That whole
support and availability of software thing REALLY comes into play here.
All religious arguments aside, I just don't see Atari being able to pull
this off. In 1985, they had a great value, but now they are just another
face in the crowd, and more people recognize the face of Apple and
the PC clone companies.

Summary: Falcons will not be cheaper than their Apple counterparts. This
is not definite yet, as Falcons are not yet available (another
strike against Atari), but it seems likely.

OS/2> >Or do you have an "Atari Cheerleader" definition for it..?
OS/2> Not really Mr. "IBM Cheerleader".

Hey, IBM or Apple, take your pick. Both platforms now provide better
value and better support than Atari. I use Macs and PC clones and
I like them both. Hell, I even liked my old 1040ST, but by today's
standards, it is a fancy game machine.

OS/2> >The Mac sequencers suck.. OK.. does that make the dealer "Anti-Atari"..?
OS/2>
OS/2> Duhh...The store doesn't CARE if the sequencers SUCK! They just want MORE
OS/2> MONEY. Easy enough for you to understand yet??

Gee, that whole supply and demand thing again. Imagine that...people want
a product so they'll pay more for it.

Better luck next time,

Chris

>you want them, not when you don't. Eric is some kind of programmer!

Scroll bars are a simple command to put in/take out! (It's a LOT
easier to not have them.... 8-)

Problem is, if you want to view the capture, you have to turn them back
on again, and because the whole thing is using GEM windowing, the screen
updating isn't exactly the fastest. (Okay, it's perfectly acceptable,
but, what the heck 8-)

Can you get rid of the shaded-bar at the top of the screen (the 'move'
bar') and the menu bar!? If so, then it's feasible. But you can only
have one or the other. (or neither if you want 80*25).

You might well be right - I didn't use it to a great extent (trying
to use it on a 1me, 8Mhz machine, with a color monitor, a 2400 modem,
and no Hard-Drive is pointless.... Makes the multi-tasking bit virtually

If you like Interlink, try having a look at FreeZe Dried Terminal.
Has pretty similar features, but with built in ANSI (not VT100 8-(
the ANSI also supports more commands, and is faster than Interlink's!

Interlink, if you go into the setup/config menu, there is a list of
emulations. One of them will say VT100 or XXXX click on this, and then
select your *.EMU file to load in as default!

If you use VT100 a lot, and want something quick, try Uniterm.

>On CI$, the recipient of email ALWAYS pays for mail (based on the
>connect time involved, I presume?), no matter whether the mail came
>from CI$, or from the InterNet.

This is only true if you are not participating in the Basic
Services flat-rate program. The flat-rate includes a large
amount of free E-Mail from other CIS members. I believe there
is a charge for sending InterNet mail under the flat-rate,
but I imagine that's because as a commercial node, they have to
pay for the interface, as GEnie does.

I haven't had a chance to check for sure, but I *think*
receiving InterNet mail is included in the flat-rate, but I could
be wrong on that...

> Vincent

I don't know about Neodesk, but in my personal opinion the Gemini
icons look pretty good (in version 1.21, the older version's big icons
weren't so cool)

And in case you don't like them, you can do your own by editing the
resource file. Just enlarge the form a bit and add yours after those
which already are there. Remember to add both big and small icons.
Could have been easier, but it's bearable this way too.

Hmm, it looks like I cannot live without Gemini anymore. That
probably means I'll have to pay the shareware fee...

SVGA is sufficient for most people's needs.. the only thing I can think of
that would need more than that is multi-media. For home users, the only
real use at this stage would be for showing off... I guess it will be
in games eventually though. There will be some pretty wicked games!!

>>>And for what reason? (I've asked! And the usual answer boils down to - showing
>>>off...) Hey, showing off is great, but I'm not shelling out for a damn

>
>Its too bad that you're ignoring the Falcon's capabilities but let me ask
>you this...(I'm assuming you're assuming that the Falcon's screen rez is not
>large enough)

Nope, I thought it would be, I wan't argueing that, I was pointing
out a reason that you need a decent resolution, after whoever I replied to
said there's no need for it.

>...How the hell do you compare something you know about with
>something you don't?

As I said, I wasn't comparing the machines, I was pointing out an example
that needs a reasonable resolution to run... at the moment I don't really
know of one for the ST (everything is designed around it's poor screen
modes), so I used one on the PC, which will also be true for the falcon.

>this new, or is my serial-port info. a little dusty?

Umm, i'm not too sure what you're asking there!

I borrowed a ZyXel modem, ideally you should lock the computer onto 38K min,
because when you connect to another ZyXel, with v.42bis data compression
they can go way up to 48K (I think .. 40 something anyway). On an ST you're
restricted to 19.2K as that's all it can handle... it does handle that
fine though, and even at that speed, you're flying along! :-)

An amiga owner told me on his standard amiga, he connects to his modem at 38K.

Now I only wish I could afford one of my own!

^^^^^^^^
>expensive than it's ST-equivalent.... A rip-off really, I don't know
>why the company isn't in the same trouble Atari is, charging such
>outrageous prices!
>

When will Atari fanatics give up on this myth? It's so easily
disproven by simply looking at some catalogs: MacWarehouse and E.A. Brown.

Here are some comparisons:
Atari Mac:
SimCity $39.95 $29.00
Space Ace II $39.95 35.00

Most of the things that are available on the Mac and PC are not even available
for the ST. For instance, while the Miracle Piano is available for the PC,
Mac and even Nintendo, it is not on the ST despite it's built-in MIDI
interface.

Also, check out the prices of the new Macs. They're not as expensive
as they used to be compared to the ST's and the clones.
Of course you can continue to bury your head in the sand.

Line-A and ROM-VDI share the same subroutines. But the VDI doesn't call
Line-A with Line A instructions, but uses direct JSR's. In addition, VDI
can do more things at once with one call (== one trap): plot multiple
pixels or draw multiple characters. This is why VDI output sometimes
is considerably *FASTER* than Line A.

OS/2 does NOT HAVE 'TRUE' multitasking!

Multi-tasking is running 2 or more processes AT THE EXACT SAME TIME!

You can't do this without a chip to do it, or without halving the
speed of the machine for each extra process! (e.g. every program
you wish to multi-task!)

If the machine has a dedicated chip, (such as a DSP board...) okay..
Maybe even a powerful enough co-processor!

It performs one operation (program #1), then the next (program #2)
etc. Which is what most programs do (or variations of it). This may
not be the exact way it works - but a stock 386, without any fancy
extras won't do it!

(fancy extra's include $300 cards etc.)

Top Ten Reasons for the Delay in Releasing the Falcon

10. Leonard heard about Video Toaster(tm) and decided to add heating element to motherboard.

9. Bob discovered a defect in the packaging and rejected the whole first batch.

8. Sam found out entire factory staff was pronouncing name "FALL-CON", not "FAL-KUHN" and fired them all citing "I only give people one chance to get it right."

7. Leonard read in the Enquirer that Ferrite bead rings cure impotence and was hoarding the entire supply in his office thus delaying FCC approval.

6. Copyright brouhaha ensued when Jack pulled into Atari Headquarters in his vintage Ford Falcon.

5. Sam's new office found to have dangerously high levels of radon: Entire new factory staff pulled from assembly line and provided with hand fans to insure proper ventilation of his office.

4. Lynx Development Team rejected second batch of Falcons when they discovered that they didn't have built-in sprite scaling/rotation.

3. Factory staff went on strike when Sam decided that ventilating his office is a privilege and that they should pay for the honor rather than vice-versa.

2. Terrifying dreams about Darek M., Dave B., and Bob R. marauding through Atari Headquarters with automatic weapons haunt Jack and forced him to temporarily close Atari Headquarters to install new security system.

And the Number One Real Real Reason for the Delay!

1. Weeks wasted as Leonard pulled Eric away from OS development and forced him to work on his new Amiga(tm)-killing idea: Multi-Toast.

Scott

I think I can quote a 386sx system that meets these requirements:

Zora computer in Computer Sources, January.

386SX basic system at 33MHz: $254.
Includes motherboard, cpu, clock, 1.44 meg floppy, ide controller,
floppy controller, mini tower case, power supply.
add Sony 1304 monitor: $550
add 1meg SVGA 1024x768 accelerated VGA card with 65536 colors: $168
this is a Diamond Speed Star 24x card. it has special driver to
offload much of the graphics processing in Windows for something
like a 20x increase in performance.

That comes to $972. I could save $50 on the monitor (by getting a non sony brand--you did ask for a $500 monitor, after all). I could save another $120 dollars by going for a non-accelerated VGA card. What would my $170 buy me? A 40 meg IDE hard drive.

So there you go. A $1000 system with hard drive 386sx at _33MHz_, $500 monitor, and a 40 meg hard drive. That wasn't so hard.

Oh, you want it from a reputable dealer? Add $300. *:^)

>I'd like to be able to reset without the modem hanging up...

This won't solve your problem, it does the DTR thing even with re-booting
this way.

What you want to do it tell your modem this before you connect to
someplace

at &d

this tells the modem to ignore the DTR signal.

of course the downpoint with using that is you can't hang up on the
other end with most terminal programs, but that's not a problem with
an external modem, just hit the power switch on it! :-)

(i'm talking about dropping carrier on them there, not on the propper
loggoff sequence of most bbs's)

Craig.

>in advance. ....

What for?

for uucp, there's Hermes, or Mercury (the former being the reccomended one)

for QWK, there's a few, MTQWK, Maximiser, Tailmail, and a few more,
but noone on internet seems to know about these. I've got em, the
first 2 came from GEnie I think, and Tailmail came to me from a friend
in Canada. All are pretty useless.

To become a fido point, there's a port of Binkley term, but it's a bit
flakey, you need several other programs with it, and it's a bitch of
a thing to set up.

If you want any of these get in touch with me by email and i'll
post a few discs to you. Mercury & Hermes are available on FTP sites.

Craig.

>it ?
>P.S. I've got a: 1040 ste with 4 megabyte and tos 1.6

maybe you left the old RAM chips inside. Then there are too many
chips sucking the power of the address lines, the driver chips are
overloaded.
You can avoid this problem by cutting the address lines to the old
, not used RAMs, the easiest point is at the small resistors before.

Greetings from Munich, Bavaria!
Walter.

1229. Upgrading an ST-520

Sorry if this is obvious to you, but my brother has one of these machines and wants to upgrade it to 1 meg or beyond. Shop prices for this seem rediculous and since I can get the memory, all I want to know is what to do.

Can anybody instruct me on what is needed to upgrade a 512k machine to 1 meg, or
is it best to pay for a shop upgrade?

Thanks in advance for any advice you can give,

Regards,

Mark Eve.

|>
|> Mark

I think a lot of the problem is not so much attitude as ignorance.
If you can't envisage a possible use of your program you're not likely
to cater for it (and working with GUI's, the programmer really needs
to cope with everything).
So people without hard disks, and who don't have much idea of how
the file system works will use explicit paths to files, people who
do just press reset when they want to loads something new up,
won't include a quit option (it seems you have to do this a lot
anyway wth all the gdos incompatibilities around).

Also, you might try to cope with a situation you can envisage, but
you can't test. So it doesn't work anyway.

One thing I would like to know is how MultiTos responds to the mouse.
i.e. does topping a window top all the applications windows?
is a window actually 'active' (i.e. recevies mouse button events). when it's
not the top one (like I'm told scroll bars are)?

and loads more.

The thing is I don't know, I can write a program which will work fine
now, but under multitos will not be useable.

So I suppose it comes down to documentation, what is there available
(cheaply - 100 quid seems steep for atari docs - better than nothing though)
to the hobbiest which not only explains how to access a file, but also
explains how you should access it.

Am I totally off the track here?

Richard

Though I like Atari NewDesk, there are one or two things missing. The most obvious of these is interprocess communication. There are several protocols currently set up for this, including a Codeheads protocol and the Gemini one which I've seen several programs use.

Recently I got a CPX which is to do with Atari's own protocol, the Atari Clipboard, using scrp_read() and scrp_write(). What's it about? How do you use it?

Also, anyone use TRASH.CPX and can give me a quick summary in English?

Thanks

David.

How about adding

comp.sys.atari.zines - Atari online magazines

To that creation list? The alt group exists, albeit with lousy
propagation, so it's not really as if it's adding bandwidth to
the net.

I wouldn't mind running the vote, but email charges would kill me.

Has the quality of the cheap Atari docs improved at all since the ST Applications review?

(For those without the review, the general comment feeling was 'Thank God', but they could have done a better editing job and made it a more professional looking effort)

Compare the price though, with buying all the Inside Mac books!!! I wouldn't resent paying #100 if the docs were well done.

I too was thinking about such a program, and I was also thinking about writing a small one. BUT: When I say small one, I really mean small. It's very probable that lot's of others would like it to be UN*X mail compatible, and that's where I stopped my thoughts. BUT: If it needn't be UN*X compatible, it should be rather easy. I've just thought about what to do that there's no deadlock if the pipe (or whatever it is that you put your mails through) get's too full. Perhaps we should start a little discussion about the facilities people would like to have. For me, personally, just a small mailer-daemon which doesn't lock up (i.e. it's really save!) and a small mailer program with just commands to r)ead, m)mail and q)uit would be enough and perhaps I'll sit down later and write it.

Irregardless of the price of a 386SX system, the question still remains,
"Why would anyone WANT to cripple him/herself with a 386SX?". These CPUs
were outdated before they were released. Absolutely useless machines.
The RESPECTABLE dealers around here discourage SX purchases; some even
REFUSE to sell SXs. So, who cares how little they cost. After all,
you can get a great deal on a Commodore 128 as well!

I have seen an offer of an SCSI Seagate 84MB Hard Drive for 125.00 pounds.
This appears to be a *very* good bargain, but it is w/out a power supply
or connector.

Can anyone advise me as to the availability and cost of these parts.I have
an Atari 520STE and have a desperate need for a hard drive, but have little
knowledge of them so your advice on this buy is very welcome.

I have also been offered the chance to buy second-hand drives from IBM
machines at my old college and I understand I would need some sort of
connectors for these too. Any ideas? Thanks very much.

Pity, that's one of the reasons I bought a 486 pc!

>PC's???? Just because thousands and thousands of computer illiterate
>persons are willing to buy a dumb machine for an outrageous price and
>slog thru DOS to run thousands of pieces of taudry software doesn't mean
>everyone is a herd animal. Load up your vaunted PC with enough cards to
>make it able to handle everything a stock ST does. Put in windows and
>norton utilities to meet the stock ST operating system, Run word perfect
>on your lauded PC is twice as slow as my ST and costs tree or four times
>as much.

Hmmmm, some considerations from a former Atari user,
but I have to add that I still think atari makes great machines.
PC's aren't that bad. It's simply a myth.
Using dos is not the best way to go but it has some nice touches to:
* Tons and tons of nice software, commercial as well as pd (or shareware)
* High quality software. There's is no point in denying this.
I uased a lot of programs on my atari and I liked them very much.
They are really high quality products, but this holds also
for dos applications.
They may not look that sexy (perhaps due to the "borland" look), but
if you want that just use their counterparts in windows 3.x

Of course you can say that windows sucks, but:
* Yes, windows is based on too old software techniques (dos)
* Yes, windows is slow on a 386sx16, but it is surpricingly fast
on a 386Dx ot 486 DX, and these machines are cheap!
* Windows looks sexy. Much better imho than GEM!
So it doesn't matter what's underneath. Windows looks good and
there are a lot of VERY good programs for windows and this is just
what people want!

So stop whining about those stupid pc's and admit that they to
can be (and actually are) used for many different applications

without any problems.

Some pros for pcs are the easy extensibility.
I mean adding 4MB to any pc (>=386SX) is very EASY and CHEAP.

> I've played might and magic on a friend's PC and if that's the quality

>machine quickly surpassed. Now they survive on the basis of the sheer
>inertia of the herd. Any machine where you have to load in A windows
>environment is archaic and not worth the plastic it's made of.

Here you go again, stop it please!

>you can't compare the two machines. The moment you load any software into
>a PC it slows down! It never does on an ST.

Sure, running software takes no time on an ATARI!
Get a hold of yourself.

More stuff deleted ...

The best way to support the Atari community is to discuss
the pros and contras of its software and hardware but don't bash users
of other systems. They made a choice and the usually had a good reason for it
(I had, linuc/c++ programming/lots of memory neede).

It is worth the trouble. There are some dirty programs that won't work in
Overscan mode, but you'be got to swich back (manually and automatically)

>Would stalker, rufus, and/or connect take advantage of it? How about
>uniterm?
Stalker: Never used it. Rufus & Connect: Yes. Uniterm: NO

>How about Spectre... would I get the extra Rez in Mac mode?
Propably no. I never used Spectre...

>There is lots of dead space on my SM124, so it would seem that this
>modification, would give me many more lines/columns of text.... is
>this true....
Even with Overscan you'll still have some border left. I got 6 more
columns and 3 or 4 more lines. That's great for text processor etc
(full 80 columns even with a window!)....

>Note: I am a monochrome monitor user (SM124)....
Same here...

>Also I have an old 1040STf... I do not have the new TOS 1.4, will this
>be a problem..?
Well, TOS 1.4 (or, to be correct 1.04) is old. 2.06 is the current version
for all ST(E) models. Overscan will work with 1.02 but I would recommend a
newer TOS version for better HD performance and less crashes...

Yeah, I know and yeah, I have. However, as impressive an achievement as MiNT is, (I never boot up my STe without it) I wouldn't mind X and more muscle as my computing needs really are starting to strain the STe.

While I think Falcon, marketed properly, could be a good move for Atari, it's not a good move for me. (Maybe their next machine, 1/2 :-))

By overlapping the windows so that only the window you're working on is
fully visible? 90% of the time that'll be perfectly acceptible (its how I
work on suns with 11?? by whatever screens - two decent sized shelltools
almost fully visible on the screen at once)

>
>I've heard about Redacteur. Where does one get it? PD/Shareware or standard
>commercial outlet? What does the word "Redacteur" actually mean?

Redacteur (I believe it means "editor" in French) is a commercial product.
An English language version is distributed by the ST Club in the UK:

The ST Club, 2 Broadway, Nottingham, NG1 1PS
Tel: +44 602 410241

Personally, I'd recommend That's Write rather than Redacteur. I'm currently
waiting for my upgrade to That's Write 2 to arrive, but That's Write 1.5 is
pretty damn good. Redacteur worries me in that it only supports 10 and 12
point text. You can make it use larger fonts, but only by hacking type
offsets around and other jiggery-pokery.

That's Write has excellent font handling (bit map only), does not require
GDOS, and is very fast both in screen display and printing. It's distributed
in the UK through COMPO (I don't have their address)

(I have no connection with the ST Club or COMPO -- I'm just a satisfied
customer of both)

It will work with an adapter board. Personally I am running a 44 removable hard drive mechanism with the new ICD LINK. It is a small adapter plug that you attach between a DMA cable and the SCSI port on your HD and it translates it. It works amazingly well and I couldn't be happier with my purchase. It costs around $90 and its primary distributer is TOAD COMPUTERS in MD.

Yes the Falcon has networking capabilities, but it's localtalk. Anyone who
has ever used localtalk knows that the only thing it is useful for is
printer sharing. The speed of localtalk is 230,400 bps. This is not
acceptable for any kind of file or application sharing.

Interesting news-item in ST Applications this month (I can't remember if
they gave it an official source):
They wrote that the Falcons were OK, but the test equipment was wrong, so
several batches were junked before someone tried to find out what was going
wrong by hand. I wonder who supplied/set-up the test equipment.

There was a story in the current issue of the UK mag ST Applications
that in fact the Falcons were OK, but the *test equipment* was faulty.
Atari junked a whole batch of good Falcons before they realised.

Maybe this is apocryphal, but it's a good story anyway.

Does anyone have access to Taiwanese rubbish dumps?

I am currently using Pha$ar (v4.06). This is a nice program but it has a few quirks that take getting used to. It has a U.S. Tax module but being Canadian I have no idea how useful it is. It supposedly available from Pacific Software (Z*Net 92-23). I paid about $40 for it a few years back.

1259. Chess programs for ST

Newsgroup: comp.sys.atari.st
Date: 1993-01-18 17:33:48 UTC
From: jmoakler@gssec.bt.co.uk
Message-ID: <1993Jan18.173348.6114@gssec.bt.co.uk>
Source record: 211655

Apologies if this subject has been done to death before.
I'm new to the newsgroup and didn't see anything in the FAQ which helped me.

I'm considering buying an ST (or the forthcoming Falcon) and one of the programs I'm interested in is chess.

I'm not too bothered about fancy graphice etc, but more in the playing ability of the program.

Does anyone have any good recommendations, along with an idea of the playing strength.

Fell free to email to me direct, and I can summarise on the net if there is enough interest.

Well Craig this may all be true but the bottom line is that cost/performance should not be the main selling feature for most people. I personally would be looking at available software as well as service and availability. Sadly the Atari sucks in this area. I might be able to track down someone who is selling new Atari's but it is getting harder and harder to find commercial software and addons for Atari (you won't believe how hard it was to find a non-atari mouse for my Atari here). I have had my Atari for many years and still love it. Unfortunately there are no longer any Atari dealers here in Edmonton (Alberta, CANADA) and it's practically impossible to find software or hardware for the Atari (any recommendations on a reliable mail order source). I cannot truly recommend an Atari to friends because of this. I think the Falcon is an impressive machine (based on literature) but if you can't find software for it who cares (sigh).

You are saying that a 386sx is outdated? Do you mean that a 32 bit processor that communicates only 16 bits at a time is too slow? Gee, didn't I just describe the Falcon030's architecture? Wake up. If you contend that the 386sx is useless, then you have to admit that the Falcon's (and Mac IIsi, Classic II, and LCII) are equally as useless. The 16MHz '030 may outperform the quivalent 386sx but because it is on a 16-bit bus, it suffers from the same problem.

Darren King, GBC --> gbcusg@gpu.utcs.utoronto.ca

Source record: 211653

No, it is not, and that is sad.
Did you ever think that Atari will maybe pass out before putting the Falcon on the market ?
You will never see any Falcon on your desk. And if you do, none of your neighbours will have one.

Bad joke, a bit childish, but Atari deserves it. They aren't any more with us. Last month, I was still sure I would buy a Falcon, now I am not sure. For the same money I could get a 386 or an Amiga 1200, NOW.
That is sad, my friends.

1267. 68040 board for TT?

From: awest@ub.d.umn.edu
Message-ID: <1jeu8hINN3et@ub.d.umn.edu>
Source record: 211656

OK, now that my modem questions have been answered (thank you all, BTW), I am wondering, how do I get the necessary software to use it. I have access to the atari archive, but how can I get a program from there to my computer at home? (Right now I can ftp throgh a UNIX system, and have access to PC's and Macintosh's with ftp capabilities. Is there a way I can get the programs from the archive onto say, a Macitosh, and then save it onto an Atari disk?) I am confused about this. Without the software, I cannot use a modem, and without the modem, I cannot access the software...HELP!

>was/is not bad!)

Ahh, somebody is talking about my favourite shoot'em up! It is better
that the number one version, it has better graphics, bigger sprites
(not slower), and I think the playability is up a little. But the
main reason for it being better than WOD I is that there is a two
player (simultaneous of course) option, so that you can play together
with your friend. The weapons are, too, in my opinion nicer.

>Thalion is it!? Does it still have all the fancy sound!?

It has the sound, and it pronounces better (or the quality is better).
You ought to try it!

BTW, I've played through all the levels, with and without a friend,
try and do the same!

>I expect you answer will be "no", so start backtracking about what you REALLY
>meant to say.

>-- DPZ

Lets see...I've got the tenth anniversery issue of 'Computer buyers guide
and handbook' here....flipping through the pages, the first 386sx system
I see is from Future Tech systems inc. Features:

386sx at 25 megahertz
2 meg of ram, expandable to 16 meg
80 meg hard disk (ide), with cache
14 inch VGA monitor <===============

price: $1169

A little over $1000, but as it's the first one I found, it seems likely
that a little shopping around would turn up one < $1000.

If you want to spend $1459, they have a 33 megahertz 386dx with monitor,
4 meg of ram, and a 120 meg hard drive.

Where can I get GFA Basic? I have no Atari support here in River Falls, (other than FTP and this newsgroup) and I don't trust any of the numbers or addresses in the software catalog that Atari sent me.

1273. Spectre GCR and Mega STe

Newsgroup: comp.sys.atari.st
Date: 1993-01-18 19:50:45 UTC
From: 6069050@LMSC5.IS.LMSC.LOCKHEED.COM
Message-ID: <93018.42645.6069050@LMSC5.IS.LMSC.LOCKHEED.COM>
Source record: 211661

I had some experienced with Spectre GCR on a Mega STe w/4MB ram and 50MB HD.
The first thing I found out (the hard way) is that Spectre GCR does not
work with a 1.44 meg floppy. Gadgets by Small claims in its sales literature
that they offer "great" customer support. The fact is that I FAX'd them four
letters, in addition to mailing them, and I never got a reply. My Atari
dealer, B and C ComputerVisions of Santa Clara, CA, also tried to get some
help from Gadgets - nothing. Through trial and error, which included removing
the internal floppy and replacing it with a 720 K floppy, and then back
again, we finally figured out that an external 720 K floppy works pretty well.
I am still experiencing the following bugs, which I understand are common to
other users of this Mac emulator. One problem I have is that once in a while,
(maybe once out of ten times), the Spectre will not recognize a Mac disk.
When this happens, I can fix this by going out of Mac mode into Atari Spectre
mode and formatting a blank disk in Mac format. Even doing it single sided
seems to work. Sometimes, the emulator will not recognize a so-called
"Spectre" format disk, either. The solution to this is the same. I have had
no luck with the so-called "Transverter" program on Spectre (the one that
supposedly tranverts Mac files to Atari files, and vice-versa.) I have had
a little better luck with a new program called "MacSee" that just came out.
It's available for about $50, and does transvert files, but it's still
pretty buggy. You have to save all word processing files to ASCII in either
mode, and even then sometimes you can only transvert one page at a time.
(Does anyone else have experience using MacSee or Spectre Transverter?)
All in all, having an Atari with Spectre GCR is not a replacement for a real
Macintosh. Spectre GCR has a lot of "undocumented features" (bugs). And
if my experience is any indication, Gadgets by Small won't be much help.
Does anyone else have anything to add?

1274. Sprites, Hardware, Chips et al.

Newsgroup: comp.sys.atari.st
Date: 1993-01-18 20:08:56 UTC
From: ph9991_imm@rivers.acc.uwrf.edu
Message-ID: <1993Jan18.140856.644@rivers>
Source record: 211667

In addition to any information on hardware sprites...

Is there any information on STe chip register/address assignments?

I'll be the first one to admit that LDW-Basic is old and unsupported, (when I first bought it, Logical Design Works was just about to close shop). But I still haven't found any down and dirty tech stuff on an ST!

So throw me your worst! (but I would prefer the best). In LDW-Basic, PEEK's and POKE's reduce to a few 68000-codes (preferred option being register-variables) I can't see any (easy) way of optimizing that.

What happened to the good ole' days of the C64/128's when you could buy ONE reference manual for the machine and you could use it to totally rebuild an old C64, or construct one from scratch? And they didn't withhold anything. (none of this "for further information consult..." bulls**t)

Is there someone out there who's trying to hide something? Hmmm... :)

If anyone can (and is willing to) share any inside info on my STe (or ST's or whatever) please help. My lack of information is my only handicap.

BTW... The revised edition manual that comes with Mark Williams C also has NO INFORMATION on hardware sprites. Damn! (though it did help alot with my bound VDI and AES routines :)

If this is the way you wish to define multi-tasking, then unix is not a multi-processing OS either, and nor will the Falcon be, since you will be able to run a maximum of 2 processes, assuming that they never want to access memory simultaneously.

Ha. Get a life, and learn what the real world means by 'multi-tasking'.

Not to quibble but Multi-tasking has nothing to do with multi-processors.
Parallel processing is a really neat to have feature for those times
when a system gets those nasty compute bound tasks.

Yes OS/2, DOS, Windows 3.1, Mac Multi-Finder, and TOS are all multi-tasking
systems. Only OS/2 is a PRE-EMPTIVE multi-tasking system. Mint/Multi-TOS
is a pre-emptive multitasking system for Atari. System 7 is a pre-emptive
multitasking system for the MAC.

I don't think there's any way to win here; if Atari bundled a CLI with
the computer, people would complain "It's hard to use!" They'l get
flamed no matter what.

I appreciate the problem with BOTH options; it is probably better that
they chose NOT to bundle a CLI, because it means that there is no
constriction of any "standardized" lowest common denominator.

If there WAS a "standard" CLI, then people would continually be
griping about people that use non-standard features of other shells.

>I saw some messages recently about a CLI called Okami in the fidonet

> to figure out how to set them up.

Mupfel is a nice little shell; it doesn't have the programming
features that other shells have, which is somewhat unfortunate.

That is, most other shells have commands to do loops, counters, and
the likes, rather than merely "simple" macros.

I'd rather have the csh "foreach" command... Very useful...

>I'd be interested to see what other people that actually make a lot
> of use of cli's think of it?

There are two truly "pro" type shells for the ST; namely tcsh and ksh.
These are ports of two of the most popular shells from the UNIX world.

I prefer tcsh; the fact that it is both MiNT and TOS friendly is a great bonus. Unfortunately, ksh does NOT work under TOS.

These shells don't have very many utilities bundled with them; you need a good set of file utilities. The advantage is that it means that you don't have to depend on the (possibly mediocre/buggy) commands that are "built-in," but can use whatever is available elsewhere.

1278. For sale: Okimate 20 printer, Printmaster Plus, EasyDraw

Newsgroup: comp.sys.atari.st
Date: 1993-01-18 22:37:12 UTC
From: georgew@tekig1.PEN.TEK.COM
Message-ID: <8318@tekig7.PEN.TEK.COM>
Source record: 211671

Printmaster Plus $10
Make greeting cards, etc. Works with most 9-pin printers and Okimate 20.

EasyDraw 2.0 $10
Drawing program from Migraph. Works with Epson FX and Okimate 20.

Okimate 20 color printer $50
My kids used this a lot for color screen dumps when they were younger, but they're into DTP now, so I bought a 300 DPI printer. This is the Atari ST version of the printer, which emulates Atari SMM804 graphics (basically Epson 9 pin) as well as doing color screen dumps and 24-pin NLQ text. Included: 2 1/2 black ribbons, 1 1/2 color ribbons, and about 250 sheets of fanfold paper. Doesn't include printer cable, since it uses a standard Centronics cable - about $10 from any computer store. Also, the current print head has one of the 24 pins burned out; new ones cost about $20 by mail order and just snap into place. I'll enclose an order form from the company that sells paper, ribbons, and print heads.

All of the above come with original boxes and manuals, and I'll pay shipping in the continental U.S. (I live in Oregon.)

From: csullogg@cc4.crl.aecl.ca
Message-ID: <18JAN93.17454267@cc4.crl.aecl.ca>
Source record: 211666

Try using an SX with Windows and SUFFER. Anyone who buys or supports
the concept of an SX must have a LOT of time to kill. Our group
actually GAVE away a COMPAQ 386SX @ 20MHz to another group so we
could get a 486 clone (which, BTW, was cheaper than the SX).

Mr. Barnett somehow feels that the 386SX actually compares
with the 68030 machines. That's like saying a 16 MHz AT running
Windows 2 or 3 is as fast as an 8 MHz ST running GEM. Hey,
I don't think so. The SX was a dog from the beginning and JUST
DOES NOT DESERVE ANYONE DEFENDING ITS EXISTENCE. Please, if anyone
must be pro PC, at least defend something worth defending.

I have a 386 @ 40 MHz with an AAMAZING SVGA monitor - it sits idle
while I run Pagestream or Calamus on my 8 MHz MegaST. Why, because
I have struggled to find well priced, easy to use PC software with
a consistent user interface that does not consume 200 MBytes of
disk space to do the type of work I do on my ST so effortlessly
and I could not. I retail both PCs and Atari equipment and I
simply PREFER to use the Atari stuff. That's the right system
for me; it may not be for the PC enthusiasts.

1280. Re: Can I run an ST or a Falcon as X-terminal?

>has ever used localtalk knows that the only thing it is useful for is
>printer sharing. The speed of localtalk is 230,400 bps. This is not
>acceptable for any kind of file or application sharing.
>
I use both localtalk and ethernet. And while localtalk is slower than
ethernet it is certainly useful for more things than printer sharing.
On my Mac IIci connected to localtalk, I do the following routinely:
- Apple file sharing (slower that ethernet, but faster than floppy-floppy)
(useful for launching small applications occasionally
although I avoid using Word this way)
- ftp and telnet (on-site file transfers of ~18kbytes/sec max,
through internet, typically <10kbytes/sec which
is about the same as with ethernet connection.)
- Network backup to tape during off-hours
I don't know about X, which is the main topic of this thread as I've never
tried it. My point is that localtalk is not as useless as the previus post
claim it to be.

>I've set STalker to keep the aborted downloads, but does it ever
>recognize that part of the file is there and just start appending
>it?

Yes, it does recovery fine, as long as the part transfered didn't get corrupted when you lost the connection. However, that hasn't happened for me since I started useing serialfix 1.1. I used to use the highspeed fix program, but it didn't do proper rts/cts. Since I switched to the serialfix 1. program, I haven't had any problems with flow control.

Also, unlike the person who got a slow down at 2400 baud with Stalker, I actually found and 19200, STalker is faster than xyz. Of course, it's hard to get an accuarate comparison, as xyz seems to use a precessor dependent timing calculation, where STalker doesn't.

> 10 megabytes of hard disk space, and the fact that one of the selling
> points of the VAX series of computers was the fact that they had virtual
> address space.)

Hi,

let's get something straight here. UNIX does not need virtual memory in the sense that a process (or in fact the sum of all concurrently running processes) can use more memory than is physically available. Swapping (on a per-process base, i e either a process is in or it is out) came into the picture quite early, but paging (on a per-page base, i e a process can be partially in and partially out) is a rather "recent" addition.

What UNIX does need, and has always needed, is a virtual address space, i e the possibility to have several process use the same logical address to refer to different physical memory locations. Look at the semantics of the fork() system call, and you'll understand.

Unfortunately, ST series machines do not have anything that even remotely resembles any kind of virtual memory/address support (as contrasted to PCs, who have virtual address translation, via segment registers, built into every CPU since the 8088 [don't flame me, I do hate Intel CPUs alright]), so when they ported Minix to the ST, they had one hell of a problem. A curious scheme named "shadowing" was finally implemented; if a process forkes, its memory image is copied to a new location. Each time the copy is scheduled to run, the original and the copy are actually exchanged in memory so that both processes run at the same address! This changes as soon as one of the processes exec()s a program and thus gets a all-new memory image.

Actually, I beleive the Falcon is supposed to have a new printer
port design with all the i/o lines available, so one of the printer port
Ethernet cards should be workable. Of course, whether anyone will write
a driver for it is the question.
One of the biggest buyers locally for the ST a few years back was a
Government research lab that used ST's as terminals for their mainframe.
They found the ST was cheaper than dumb terminals for the machine, and
could be used for local proceessing as a bonus. I wonder if a
screenblaster like hack could get you a high res 2 plane screen mode, or
even 3 or 4 planes for greyscales. Does anyone know?

Come one, you can do better than that:

What Jack did when he was giving out Atari stock to his sons, and got to Leo:
Allot remainder

The lucrative, high-profit job Leonard used to do:
Almond retailer

Leonard at a press release:
Animate droller

Leonard's new job in Tiawan:
Terminal loader

What happened when Leonard read the annual profit and loss report:
Atari-men rolled

>faster than whatever the falcon's capable of.
>>real-time sampling/playback? 386-16? pshaw!) Oh and how about the incredible
>>sampler BUILT-IN to the Falcon? You'd need an incredible sound card to have
>>16bit sound and 8 channels (4 stereo channels) with sampling/playback with
>>digital distortion fx...(don't think there's one that EXISTS). In fact, the

You are failing to take into account the DSP chip. This increases the speed
and power substantially to make the Falcon fully comparable with the 486dx.
I have used the Falcon, and I can say that I have seen graphic manipulation
that I have NEVER seen on the IBM (I also own an IBM)! As for the speed of
the Falcon, it all boils down to a few facts: 1) a 68030-16 outperforms a
80386-33. Just back-read some posts or even read Amiga newsgroups for a little
while and you'll find ample proof. In fact, even the 68000 can whip a 386 in
a lot of fields. The motorola is just a better chip.

>you know, you can get what you're looking for not much more than $300.

From where? The heaven's above? NO WAY can you get a 16bit, 8channel,
capable of 50Khz sampling rate sound card for the IBM for "not much more
than $300". That's BETTER than CD quality if you didn't know...(CD samples at
44.7 KHz).
>
>>Falcon sampler is better than a lot of commercial DEDICATED samplers!
>
>You know not that which you speak, sir. I sold Ensoniq samplers for a time,
>and they were certainly capable of everything you suggest the Falcon is.

Its really hard to take you seriously here... In fact its pretty impossible...
Okay, the Falcon has 16bit 8channel mono, 4 channel stereo, capable of up to

50 KHz sound. An Ensoniq sampler that matches all those spec's costs
$2500CDN. Don't believe me? Try checking up on the Ensoniq 16R! Anything less
than this is already inferior no matter what the cost. Not convinced? How about
the AKAI S1001? This is slightly better than the Falcon (it has a few more
channels) but the price tag? $3000+!! The AKAI S1000 is a little inferior than
the Falcon and yet it still costs $2000!! More examples?? Anything less than
the ROLAND S700 series of samplers is inferior to the Falcon. Want to know
how much anyone of the S700 series cost? In the neighbourhood of $8000!
I could go on and on here, but I think you can catch my drift. In fact, its
pretty damn ironic that my friend just recently bought a Ensoniq 16R. Taking
one look at the Falcon specs, he started regretting that he shelled out so
much money for a dedicated sampler!

>>How about the midi capabilities??
>>
>Good music boards have them. Better support for the Falcon, though, I'll
>giove you.

Not only better support! I used to own a sequencer for the IBM... It was
far, far inferior to what I used when I FIRST joined the Atari market. Even
to this day, I have NEVER seen a half decent sequencer on the IBM - nope, not
even the Cubase port. If you think the port was good, you had better take a
look at the "old" ST one...The results will stun you.
>
>>I admit four times the price is a bit much, but twice as much is much more
>>like it.
>>
>>Oh yeah, you can't just call a 68030-16 a 386-16! In fact, its ludicrous to
>
>Like calling apples oranges. Get some benchmarks sometime. They're not too
>far apart, the two.

EXACTLY!! You can't compare the two at all! What's your point here? They're
not too far apart??? First you say they're totally different, then you say
they're not far apart? What's your argument? As for being similar...looks
like you've been brainwashed into thinking that Intel is even close to being
as good as Motorola. You know the recent chipspeed doubling that Intel just
pulled? (The 25Mhz to 50Mhz switch) That technique was used by Motorola years
ago! In fact the technology gap is so wide between the two, IBM is already
pulling out of Intel and investing in Motorola - re: their RISC computers.

ARS> of a percentage (percentage of MONEY, if you couldn't figure
ARS> that out...)

You still haven't answered BobR's question, have you? I wonder why...

And about comparing prices of Macs and ST's: I think you are in dire need of a reality check. Students at universities in the States can get a IIci nowadays for less $1300; that's a 25 MHz 68030/68882, plus usual Mac goodies thrown in for good measure. ST's _used_ to be cheaper than Macs. Now, if you can get them at all, you get an obsolete 8 or 16 MHz 68000 machine, whose software base is steadily shrinking. Feel free to delude yourself, though. But you're gonna feel very silly in the morning.

Oh, BTW, how about answering BobR's question?

Yup, it's true, and no, not really money hungry. I pay $15 per meg
for my international mail, and $3 per meg for my national, no, that's
not through GEnie, that's through the internet site I use. It's the
only one here, and that is the real cost of the mail to them, they
just pass it on to us.

>CompuServe does not make you pay for Internet e-mail, correct?

Nope, but with the fees they charge, it's no wonder they can do that!
Like it's over $60 per hour ($1 per minute) .. that's $30US, or US$0.50 per min

Huh? I was talking about the sequencing part of the Atari. Why would I want
to spend $1600-$1700 for a computer when I can get a 1040STFM for, hmmm
$600 and then buy Cubase or something for about another $200-$300? Buying
that MacLCII is totally useless if you ask me... As for the Falcon, I wasn't
even TALKING about it! You don't need a Falcon to sequence!! Any old 520ST
with a bit more memory or HD is good enough! My set-up (4meg 1040Ste, 2
monitors AND sequencing software -Cubase & Notator) cost me .... about $1000)
will run rings around ANY MAC (I'm not even gonna bother comparing a PC to it)
at the same price! Plus I have the added advantage that the sequencer I use
is one of (if not THE) BEST out!
>
>Better luck next time,
Big words from someone who: a) doesn't know what I'm talking about.
b) calls an ST a GAMES machine (shows how much you
know about it...)
and c) doesn't even own one...

Well, here in River Falls, I go down to the PC lab and hop onto a
'486 using dosshell and Proterm. Then I login, do the necessary FTPing, and once
the files are in my account, ZMODEM them to the PC! Then it's just a matter of
copying the files from the TEMP directory on the PC onto an Atari disk (msdos
compatible)

Friday Night Special Edition Real Time Conference

Dateline Atari! with Bob Brodie

Host - Lou Rocha

Friday, Jan. 8th, 1993

<[Lou] ST.LOU> Happy New Year to all our GEnie members! Welcome to the first 1993 installment of Dateline Atari! with Bob Brodie. Bob is typing at us from Sunnyvale, the home of Atari Corp. and we expect to hear all the latest developments, especially with regard to the Falcon and its software-in-progress.

This week we saw a post from John Towns that SpeedoGDOS was very, very close. There was also a later comment that it will be sold due to licensing fees. Let's start there... Bob, what is the status of SpeedoGDOS?

<Everyone else, please /RAIse your hands if you have a question for Bob.>

<BOB-BRODIE>
Good evening, and a Happy New Year to one and all! I hope that the holidays were enjoyable for everyone. I know that I enjoyed the time that I spent with my family in the two weeks of vacation time that I had over the Christmas holidays.

Let's get started and talk Atari!!

First I'd like to give some status reports on some projects that we're working on here at Atari. MultiTOS has a recent beta version go out to our developers just before Christmas. This version appears to be working quite well, although not perfect (I found a bug today, and got it fixed!!). We're now focusing on an installation program for MultiTOS, which was presented to me for evaluation yesterday. You'll be pleased to know that the entire package fits on a single 1.44 meg floppy. At this point in time we're planning on allowing ALL Atari 68000 computers to be able to run MultiTOS. There was some discussion that we might compile MultiTOS in such a fashion that only users with 68030 boards, TT030s, or Atari Falcon030s would be able to use MultiTOS. In speaking to the TOS group, they feel confident that they will have a shippable version of MultiTOS next week. Still to be decided is how we are going to distribute MultiTOS to our customers. Once that decision is made, we'll let you know via an announcement here on GEnie, and in Atari Explorer Online Magazine.

SpeedoGDOS, our scalable font replacement for GDOS/FontGDOS/FSM GDOS is just about ready, too. As is the case with MultiTOS, we're evaluating the installation package very carefully so as to make it very easy for end users to install SpeedoGDOS. Presently the package consists of a five diskette set, which includes lots of BitStream fonts. I have been VERY impressed with this system. I had lived with extreme system slowdown when running FSM GDOS with more than 12 fonts on my system at work. I'm now running 71 Speedo fonts, with no noticeable performance degradation at all!!

Our customers will be able to call an 800 phone number that BitStream operates to order fonts to use with SpeedoGDOS. While not all of the BitStream font families have Speedo fonts in them, there is over 1,000 typefaces available that do.

We've decided to change the name of Concierge (previously ST Sutra) to Atari Works. It is still undergoing some testing, although it is much improved from when it was shown back at the Toronto Show last April. Much of the work has focused on the database portion of the program to improve the database import capabilities of the program. We're in the process of expanding our beta test group, and we're getting lots of good input from them for improvements in Atari Works. I'm very pleased with how the program is improving, and am even starting to use it myself much more often than before. Many of our staff members here at Atari, like the Administrative Assistants are starting to use Atari Works for their everyday word processor of choice.

Now, regarding the Atari Falcon030. I spoke at length with Sam Tramiel about the production/shipment status of this product on Monday. The sub-contractor that has been manufacturing Atari Falcon030s for us has not been able to meet our Q/A or production requirements. The number of the machines coming from this factory that have failed diagnostic tests is completely unacceptable to Sam. He is _angry_ about this, as producing Atari Falcon030s is of paramount importance to us. Representatives from the factory

were due in Sunnyvale on Monday afternoon to discuss a resolution of these problems with Sam. Regardless of the outcome of that meeting, Sam indicated to me that he was meeting with a representative from another factory to bring on board another manufacturer to produce Falcons for us. We expect this to delay significant shipments of Falcons until March.

There have been some rumors circulating that the Falcon030 is not FCC approved, and this is reason for the delay. This is simply not true!! As Atari indicated months ago, the Falcon has met with FCC approval. I note with some amusement that a request for FCC numbers was made by ST Report's staff in the message bases on GEnie, AFTER our offices had closed for the holidays. Until today, there was never a request made to our offices for the actual FCC number via anything resembling conventional means, like a phone call, letter, or fax. Not even a request in email!! Today, Ralph Mariano called me and asked about the FCC status of the Falcon, and discussed in detail with me his attempts to have the FCC provide him with the number. I don't understand why he has had problems getting this information, as it is a matter of public record.

At the time of his call, I didn't have the number at my desk...but I do now! So, as promised, here is the FCC approval number for the Atari Falcon030: EBAF030ST, application dated September 18, 1992, granted November 5, 1992.

Falcon030s will continue to be available in small quantities until we get our second sub-contractor on board, or the production problems with the original contractor are resolved. Review units are being provided to publications that we believe can assist us in "getting the word out" on the Falcon. I'm ready to take on any questions that might be ready, Lou!

<[Lou] ST.LOU> Thanks Bob... our first question is from JCD at New Dimensions. Go ahead JCD

<[JCD] NEWDIMENSION> Bob, what are Atari's plans to help deter low-ball prices from mail-order houses? Will The Falcon only be available through Atari or will they be available through distributors, too? Atari only, I hope.

<BOB-BRODIE> Hi Jeff, we are working on a new dealer agreement that we think will have a lot more "teeth" to it, something akin to what some other well known manufacturers, although not necessarily a computer manufacturer use as their dealer agreement. We feel, as do many of our dealers, that the issues isn't so much mail order, it's the price that the units are sold for. ga

<BRIAN.H> Hi Bob, A few people have been inquiring in the BBS about an up-to-date list of AUTHORIZED Atari Service Centres. This would prevent some mail order problems and keep the customers happy. Can this be done? ga

<BOB-BRODIE> Brian, I'd prefer to hold off on that, since we're in the process of re-doing the dealer agreement. I can understand the concern about some users in finding out about authorized vs. Non author.. and I'll try to make that available AFTER we have the new set up done. Probably happen in April or March. ga

<[Lou] ST.LOU> Thanks Brian. Next we have Andreas from AEO magazine.

<[Andreas@AEO] AEO.2> Atari Works(better name!) is a great program, and with the addition of Speedo, even on a mere MSTe, it is fast and clean. The output is some of the best I have seen on my DJ500. I hope we can see this program bundled with new machines and available for older machines too... can you expand on this Bob?

<BOB-BRODIE> Hi Andreas, I need to send you an updated version. You're not... up to date with some latest changes!! Atari Works is a fully integrated data base, word processor, and spread sheet with a spell-checker and thesaurus included with the program. I think as you have indicated, everyone will be very pleased with the results of the product. Many different printers are supported, and the new installation program makes things a BREEZE! ga

<[Lou] ST.LOU> Thanks Andreas... you took part of my question ;-) Next we have Chris Cassaday.

<[Chris C.] C.CASSADAY> Bob, all that you have said is extremely good news! Any comments on pricing of SpeedoGDOS, MultiTOS, and Atari Works? And when can I realistically expect to see them on my hard drive? About Multi-TOS: Are there separate 68000 and 68030 ? ga

<BOB-BRODIE> Thanks Chris, re pricing on MultiTOS, I'm not sure what the price will be for it. I'm confident that you'd love the pricing I have in mind.... I think we should UPLOAD it exclusively to GEnie, and let nature take it's course. I'm not 100% sure that will happen at this point, though...but it might!! Pricing on Speedo is more related to the pricing of the fonts. We have to pay a royalty on the fonts, and that is the real determining factor. Works is probably going to retail for about $100, and perhaps be bundled with all machines that are sold after it's ready. ga

<[Lou] ST.LOU> Here comes Jonesy!

<[Jonesy] M.JONES52> Bob, are the review units being bundled with a 'setup package' to help the reviewers get a representative look at what's available now, and a taste of things to come? And what's in it? <g> (Love your idea for MultiTos, btw!)

<BOB-BRODIE> Hi Mark, yes they are. We also bundle a copy of the International Software Guide. We try not to show them too much of what the ... future might hold, as we want them to write about the here and REAL SOON NOW <grin>, and yet show them that we are

planning for the future. ga

<[Lou] ST.LOU> Ringo is next Bob... on his own account so be gentle!

<[Ringo] R.MONFORT1> Bob B. I notice that Computer graphics world magazine had a Falcon announcement what other publications will have a Falcon for review. specially the ones that doe multimedia? GA

<BOB-BRODIE> Yes Ringo, we have made inroads with about 19 different mags to have announcements and or reviews on the Atari Falcon030. Let me look real quick on my desk and see if I have it handy... Found it! Applied Techniques, Business Week, BYTE, CNN, Computer Retail Week, COmputer Technology, Computing NOW, Datamation, Design News, E.Q. Magazine, EDN News, Eyecom Magazine Keyboard, Motorola DSP Newsletter, MultiMedia World, New Media, Newsbytes, Noteworthy, PC Laptop Computers, Scientific Computering & Automation, Studio Software Report and a bunch of others that I can tell you about in email! :) ga

<[Lou] ST.LOU> JCD is back with his second question... then C.FLUEGEL and Kent Cavaghan. Others may /RAIse their hands again! ;-)

<[JCD] NEWDIMENSION> Will Jerry Pournelle be getting a Falcon soon? I understand he's had an Amiga A1200 for some time now to review. Also, MultiTOS looks great on my TT030. I think everyone will be very pleased. ga

<BOB-BRODIE> We have already spent quite a bit of time with Jerry showing him a Falcon030, and expect him to get a review unit soon. We opted to provide one to BYTE Magazine first, rather than just one for Jerry. Perhaps saying JUST one for Jerry is a bad way of phrasing it, because obviously we want him to have one. I was present when we did the demo for him, and he's very enthusiastic about the Atari Falcon030. Especially the sound capabilities. I agree with your sentiments about MultiTOS, I'm in the process of doing everything to it that no one should do <GRIN>, and finding a few more interesting events. Eric Smith was in my office for a while today, and we had a nice time...and an update came out in a matter of hours. ga

<[Lou] ST.LOU> GA C.FLUEGEL.

<C.FLUEGEL> I was talking to James Grunke about the NAMM show and the Falcon roll out. He said originally he had planned on having plenty of Falcons on hand but that there were problems and he may not have any for sale, but he hoped to have a few. What are the current plans at the NAMM show? As the Falcon already has a good following in the Audio Realm (I get people in everyday asking about it, they don't know who makes it, but they here it is supposed to be great)... How big of a showing will atari have??

ga

<BOB-BRODIE> We have a very large room at NAMM this year, that will feature... 16 workstations with developers manning them. There will be a number of Atari Falcon030s there for people to see, and try there In the event we are able to resolve our problems with the production at the factory (particularly with the Q/A issues) then we will be able to fill the orders that much sooner. I expect to take orders for machines at NAMM, we will once again, be the premier computer at NAMM, as Apple and IBM have both bowed out. There has been terrific coverage in the music mags have been ringing my phone off the hook for information on the Falcon. I can also assure you that the show will be well covered here on GEnie, and in the Atari Press as well. Atari Explorer Online, our official online newsletter, and the excellent Z*Net Online magazine will be covering the show, as well as AtariUser Magazine providing the memorable print coverage for the show. ga

<[Lou] ST.LOU> Thanks Bob... now we have Kent Cavaghan. GA Kent

<[Kent@OakSpri] K.CAVAGHAN2> Bob, in regards to your idea on uploading MultiTos, would disk vendors be allowed to distribute it as well or will it be limited distribution like FontGdos (just curious :}) I think it's a great idea either way. ga

<BOB-BRODIE> Hi Kent, I confess that I haven't even considered that at this point in time. I'm much more focused on getting the product done. I appreciate you bringing that issue to my attention, and I'll be sure to pass along that concern to the staff here. Good Point!!! ga

<[Lou] ST.LOU> GA Matt Rivman.

<[Matt] M.RIVMAN1> Mr. B. (Bob) I appreciate the entry level status of the Falcon 030 and agree with it. But as one of those who long for tower, pizzabox', detachable Keyboard what can you say about near future 030, 040 config's ? Sorry to harp on it! Re: Apple and IBM bowing out of NAMM .... Cowards!

<BOB-BRODIE> :-) Hi Matt, I've always respected someone who knows when to do a graceful retreat! :) Re the Falcon box, let me put it this way....we've made other entry level home computers in the past, like the ST, and the STE. Both of them _ultimately_ were placed in a two piece unit later on in the products life span. So it is not unreasonable to guess that the Falcon might one day be in a different case...many of our products have. But the real issue is when will it happen? With the ST, it was over a year after the original machines shipped. With the STE, about two years. ga

<[Lou] ST.LOU> GA Andreas.

<[Andreas@AEO] AEO.2> Atari ST Format had a comparison of the A1200 to the F030, favoring (guess who?) AEO should have an article based on a similar topic soon. Already there are graphics cards and accellerator cards available for the F030. Bob, do you think once the crush is over we can get the TOS crew on GEnie or Delphi to bug them about TOS hints? thanks Lou!

<BOB-BRODIE> Sure, that would be an excellent idea, Andreas. Once the "crush" is over, I think we can probably get someone like Eric Smith (who will probably kill me for volunteering him) online for a CO or for some activity in the message bases. Of course, here on GEnie, John Townsend is already online, although not as active as before. There is a topic here on GEnie for programming q's to be left to TOWNS, I think it is CAT 3 Topic 31...could be wrong though! :) ga

<[Lou] ST.LOU> Harj... save us! ;-)

<[Harj] H.NAGRA1> Any idea on the number of Falcons that will be released in January to the general public? I'm very disappointed in the delay...any chance the Falcons in March will have the much rumoured new case design? ga

<BOB-BRODIE> Harj, I'd prefer not to give out actual numbers, until they are in the warehouse. Believe me, when I spoke to Sam about the availability of the Falcon, he was thoroughly disgusted with the entire situation. The shortage of the Falcons is not a US problem it is a world wide problem...we're almost competing against our subsidiaries around the world to get product at this point in time Re the case...check out my answer from before. :) I share you disappointment in the delay and so does Sam.

<[Lou] ST.LOU> Ready for more Bob? Chris. GA.

<[Chris C.]
C.CASSADAY> Bob, there are some rumors in Euro mags about CD-ROM versions of the Falcon030. Can you comment on future variants of the Falcon030, and whether these new machines will necessitate the newer cases. ga

<BOB-BRODIE> Chris, No...I can't. Other than what I've already stated about the case structure in other questions. There is no question that the machine will mature, the question is how quickly will that happen. Current versions of the Falcon030 are ready for a CD unit out of the box, there will be no reason to wait. I can only guess that having the CD included (if such a thing were done) would be reflected in the price of such a wonderful machine. :) ga

<[Lou] ST.LOU> LYRE from AEO... fire away!

<[33] Lyre] AEO.3> Bob, you mentioned that their will be developers displaying their products at NAMM. Can you tell us which developers will be attending and the programs they will be demonstrating?

<BOB-BRODIE> I can tell you the developers, but I'm not 100% up to speed on what they are going to be showing. The developers are D2D Systems Chro-Magic, CodeHead Software, Barefoot Software, Goldleaf Pub. Thinkware, Dr. T's, Compo, Gadgets by Small, Hotz Technology, Digital FX, Okital, Steinberg, and Yamaha, along with a new developer that I am not personally familiar with name MGI. They are from Germany. GA

<[Lou] ST.LOU> C Fluegel.

<C.FLUEGEL> VERY large hard drives, where and what will be available? Is PLI still supporting the Atari? SCSI-2 and 2 1/2 drives are still quite uncommon. Also, when will WE the public and or dealers find out how the meeting with the folks who are actually building the Falcons went? GA

<BOB-BRODIE> I think it really depends on the application that you're using as for how much hard disk space you will need to get things done. I've not had any problems with connecting any type of common disk drives, like a Maxtor to a Falcon030. You don't have to have a 2 1/2" drive, that's just what the IDE drive is that is internal for the Falcon. Since the SCSI-II port is there it is EASY to connect up bigger units. We have hooked up 340 meg Maxtor units with no problems, pulled 'em right out of a TT030, which isn't SCSI-II. Please bear in mind that the pricing on the hard disks is not something we control, but is the same for all of hard disks that are produced across the market. Re the meeting... after I have a chance to speak to Sam, I'll try to pass along the meeting. I can assure you he wasn't going into the meeting with the reps that are NOT meeting our expectations with a smile on his face. On the other hand, the second company that we will be bringing on board is run by an old friend of the Tramiels, and I expect to see results from them quickly, like within a month. ga

<[Lou] ST.LOU> Oooo... I love techie-talk, Bob ;-) Next we have JCD, then Chris Oates and George from JMG Soft in Hamilton, CANADA! GA JCD...

<[JCD] NEWDIMENSION> Concerning the redesign of the ST Book, what are some of the changes it is going through? Additionally will the floppy drives in future machines ever be replaced with Floptical drives or the like? C.FLUEGEL: We sell fixed HD's up to 3.6 Gig!!

<[Lou] ST.LOU> Nice plug JCD ;-)

<BOB-BRODIE> You forgot to include pricing, Jeff. You're slipping. <-: Re the ST Book, you can expect things like back lighting in the LCD screen, and possibly floppies or PCMIA connectors. There are some discussions about changing the microprocessor in the unit to something that is a little bit more "contemporary" than an 8Mhz 68000. Please bear in mind that we're focusing on the Falcon and the Jaguar right now, the ST Book is not getting 100% of our attention at this point in time. ga

<[Lou] ST.LOU> Chris Oates, thanks for waiting. Your question please?

<C.OATES2> Hi Bob. I already take the hypothetical nature of two-piece Falcons as a given, but do you see it as likely that if and when such machines ship they will contain the VME bus slot that we Mega STE and TT owners have? I for one have already invested a good deal of money in a Crazy dots 15 board, which surpasses current Falcon graphics (and possibly future) and would like to think that I can take the card with me when I upgrade my machine... GA

<BOB-BRODIE> Chris, obviously I can't make promises about such a prospective product with certainty, but I will be happy to encourage that suggestion to the design team. We use graphics cards here at Atari as well, and believe me, we hate spending money we don't need to just as much as you hate to. ga

<[Lou] ST.LOU> Let me put in an extra plug for the VME Bob! Now we have George from JMGSoft.

<[George] JMGSOFT> First off, thanks Bob for doing these RTCs. I don't envy the position myself... But to the question... What is being done, if anything, for the Canadian market. Since the Canadian Sub closed up, it has been pretty bleak and dismal up here when it comes to Atari support. No service, information, parts, and things just aren't ticking very well. I am still trying to resolve issues that date back to August when the subsidiary closed up. It this all we can expect up here in the North? It doesn't look pretty, since I don't think the Atari brass considers Canada too seriously anymore. GA

<BOB-BRODIE> George, I was not aware that there were problems in getting service and repairs done. We have a specialist in Canada to deal with our Canadian dealers, who is well acquainted with Canada in the persona of Randy Tjin. Before we went off on holidays, Sam and I personally checked on the repair logs, and we were told that they were running about a week to get each item out, and in fact were on target for their dates. If there is other needs that haven't been taken care of, please FAX the details to me at the office so we can address them. Certainly the changeover to the US from Canada has not gone smoothly, but we are committed to continuing to do business in Canada. If you have specific needs as far as information goes...we know each other, George. ASK! My address online, and phone numbers are pretty well known, and I invite your call. Thanks for the comments about being online, though!

<[George] JMGSOFT> Thanks for your continuing commitment. I'll be in touch :-)

<[Lou] ST.LOU> Dave Stuart is the last one in line.... last chance to /RAIse your hands folks. GA Dave. Bob... let me know when have had enough for this month ;-)

<[D. STUART] AEO.7> Does the FALCON include any 'bundled' software? And if so, is there an opportunity to develop said software directly for ATARI ??? GA

<BOB-BRODIE> Yes, the Falcon will be bundled with 8 applications when it is shipped. The products include Audio Fun Machine, Falcon D2D, a direct to disk recorder, System Audio Manager, ProCalc, a full scientific calendar, Talking Clock, CalAppt, a calendar/rolodex type of utility, and a couple of games, BreakOut and LandMines. YES...there is an opportunity to write that software for Atari. We in fact used outside developers for some key components of the software, like the System Audio Manager. GA

<[Lou] ST.LOU> Here's Dorothy...!

<D.A.BRUMLEVE> I've seen numerous rumors about the Falcon already shipping to dealers in small quantities in Germany and in England, and yet you refer here to "when it is shipped". Are the rumors false? Or do you just mean "when it is shipped in NA"?

<BOB-BRODIE> Excellent question, Dorothy. I do in fact mean in North America. There are small shipments of Falcon030s being sent to dealers in other parts of the world. Some of those units have been sold without MultiTOS, and with other minor problems. Like the CalAppt Manual that shipped in Germany is written in English. Another example of the Q/A problems that we've had with the factory.

<D.A.BRUMLEVE> I don't think many of us would consider an English manual a problem. ;-)

<BOB-BRODIE> Virtually all of the machines that we've had here in the US have gone to either review sources or developers. I agree with your sentiments about the English manual here, but the German TOS and Keyboard might prove challenging...or should I say educational??? <grin>ga

<[Lou] ST.LOU> Whew.... you must be getting tired. Four more Bob.

<[Lou] ST.LOU> Kent Cavaghan, C.Fluegel, Dave Stuart and Brian Harvey.

<[Kent@OakSpri] K.CAVAGHAN2> Bob, there has been some concern about registrations that are sent into Atari and what if anything they are used for? Will the lists that are created used for follow ups and promos or are they just being recycled :} ga

<BOB-BRODIE> Kent, they are indeed used, we build customer lists from them and they are in fact used for follow ups. We expect to be using them much more in the future than in the past. GA

<[Curt/ Guitar] C.FLUEGEL> The original plans were to have "demo units" at dealers before Job 10 is now listen-only. any major rollout, is this still the plan? Even if you have to change

manufacturers, can we still expect to see a demo unit here at Guitar Center? (James Grunke said we should, I hope it is true).. GA... Ps if I send you $900, will you send me a Falcon j/k

<BOB-BRODIE> Curt, the bidding is much higher than that at this point....NO! <grin> Seriously, we intend to make demo units available for the dealers and regard this as a very important step in the process of both selling and marketing the Falcon. We do have a demo unit plan for our dealers that purchase directly from us, which is one of the benefits of dealing directly with Atari, rather than thru another re-seller or distributor. We have, when possible, shipped units to dealers for special exhibitions on a temporary basis. If you have a specific need for a unit for a really important event for your dealership, then feel free to contact me. ga

<[Lou] ST.LOU> Dave Stuart... from AEO! GA

<[D. STUART] AEO.7> BOB ... Just thought I'd mention here, then, that I've E-mailed you a proposal re: the previous query! Aside from that, what is the latest concerning AIM - if you know anything. I know this is a change of topic, but one of interest to all! GA

<BOB-BRODIE> I always forward those things along to our dev support group, but I'll be happy to send it along again. We do get an awful lot of those, it's possible that they overlooked yours, and for that, I apologize. Regarding AIM, I really haven't spoken to Pattie or Bill in sometime myself. I know no more than you... it's been a while since I've seen an issue of AIM, and they seem to be a bit behind in their issues. But since Explorer is also a bit behind, I'm not about to cast stones. But since we're now speaking about EXPLORER, I'm happy to report that the latest issue of Atari Explorer has just come back from the printer, and looks FABULOUS! This is the first issue under the capable efforts of Mike Lindsay and Darren Meer since they have taken over the magazine. Mike is lurking tonight here online as AEO.MAG, so be sure to say hi to him!! ga

<[Lou] ST.LOU> Our last questioner is from my fellow RTC sysop... Brian <Brain> Harvey. ;-) GA

<BRIAN.H> What about the Jaguar? Will it be finished this year? Is it as good as the rumours? Will this be the GAME machine??? I am not trying for rumours, just the facts [grin].GA

<BOB-BRODIE> Hi Brian, it looks FABULOUS. Sometimes mere words are a poor tool to describe things...and this is one of those cases. During my discussions with Sam earlier this week, we went over to the lab and had a peek at the Jaguar. I was astonished at the quality of the machine. We've begun shipping developer units out now, and have had developer symposiums for the units as well. The

very-well-known-programmer, whose name I cannot reveal that is here in Sunnyvale working with us on the Jaguar is VERY enthusiastic about the machine. The demo that he showed us was extraordinary, both colorful and fast, the horizontal scrolling was smooth, and very, very very fast!!!! Howzat, Brian?? :) ga

<BRIAN.H> Thanks Bob. Sounds great!!!!

<[Lou] ST.LOU> Bob... while you get your closing statement ready.. Brian has a little announcement... then so do I ;-)

<BRIAN.H> I have a quick plug for the next RTC!! Everyone, don't forget the roundtable conference next Wednesday night with the IAAD. What's the IAAD? The Independent Association of Atari Developers (IAAD) The RTC begins at 10 pm EST, Wednesday, January 13. Ask about current and future products. Meet the folks who bring your computer to life with software and hardware enhancements!

<[Lou] ST.LOU> Thanks to Bob for a magnificent evening and thanks to all the users who stopped by - old and new faces alike... especially my good friend Martha Dycus who stayed to the very end! Yea Martha! I would also like to mention that the inaugural GEnie Notes Column will appear in the next issue of Current Notes! Eight pages of great GEnie news. Make sure your friends see it!

<[Lou] ST.LOU> OK Bob... you were great, great, great!!!! So you can have the last word tonight. GA

<BOB-BRODIE> Lou, thanks again for doing such a stellar job of running the RTC. Once again, I've had a wonderful time being here on GEnie, our official online service. I appreciate the opportunity to gather here on this monthly basis, and think that it will continue to work well for ALL of us. I'm looking forward to next months CO already with great anticipation, the first ones have gone over so very well. Thanks again for attending, and good night!!

Dateline Atari! with Bob Brodie is held on the first Friday of each month. Watch the RTC Banner for details. See you on February 5th, 1993 for the next installment of Dateline Atari! with Bob Brodie.

You are also invited to drop in on Monday or Wednesday evenings each week. Bob Brodie can often be found "with the gang" on those nights too! All Real Time Conferences begin at 10:00 p.m. Eastern Time.

1301. ADVOCACY: 386's ARE under $1000 WITH monitor

>
>Dave, do you really mean to say that those great "under $1000" prices people
>have been slinging around as the typical cost of a -386SX system INCLUDES a
>$500 monitor?!?

OK, I'm not going to post that a 386SX system is less than $1000 with
monitor. Actually, I'm going to post that a *386DX-40* system is less
than a $1000. This time, I'll take the liberty of posting the name and
phone number of the company:

November 1992 PC Sources, p. 546
"Dee One Systems"
(800) 831 8808

386DX-40 Motherboard & CPU w/64K cache
4MB RAM
1.2 and 1.44M floppies
130M hard drive
SVGA card
SVGA (multisync) monitor
Internal clock/calendar
Case & power supply
101-key "enhanced" keyboard

System cost: $994

Note that these prices are at least 4 months old. The current prices
are surely somewhat lower.

>I expect you answer will be "no", so start backtracking about what you REALLY
>meant to say.

Ah, no.

ARS> 320x200x32000?? Child's play on the Falcon. Without the
screenblaster,
ARS> the Falcon goes up to 768x428x256, btw. And I'm pretty sure
ARS> the Falcon goes up to 320x200x65536, 640x200x65536, the rest
ARS> of the higher resolutions being 256 colour modes.

Do you have any idea how much that slows performance? Howard Chu posted
(in c.s.a.st.tech I believe) some timings of running an ARC on the Falcon,
in various graphics modes. The results were that in the "true color"
(which it isn't) modes, the execution of the ARC slowed down dramatically.

ARS> Well, when I put memory into the computer, voila!, more memory
ARS> goes into the graphics capability as well, whereas you have

Yeah, only you can't put memory into the Falcon. It comes in 1,4 or 14
megabyte configs; so you must upgrade from 4 to 14 if you want any more
RAM, and that is done with some highly non-standard method. You can't plug
in the cheap SIMMs you can use on any MS-DOS machine or Mac.

ARS> to upgrade both _separately_! The "poor fool" doesn't have
ARS> pathetic drivers, its just his computer's too slow to handle
ARS> it. Windows at that rez will be mucho slow unless you have
ARS> a 486-33 at least! Here we are comparing graphics capabilities,

Wrong. Windows runs quite well (faster than a normal ST in fact) on most
386 systems.

ARS> and then you suddenly jump to a 1bit system... Do you know
ARS> WHY its running at 1bit (2 colours) ? Because if it was any
ARS> higher, the system would be _extremely_ slow! Oh and also,

No. Because there isn't any bandwidth left to display more. And, have you
ever heard of graphics accelerators? In the Mac world they are common, on
sold with most 24-bit color cards. Any such thing for the ST or Falcon?
Forget it...

If you want to talk about slow, you should have a look at a Falcon
scrolling some text. At the Atari Messe in Duesseldorf last August, I
played with a Falcon running a word processor, and scrolling one line up
took almost a second. You could literally see the first the red part of
the text being drawn, and only after that it became black. That's _real_
slow.

ARS> Why is it so "appropriate"? Why not just have multiple windows,
ARS> more or less, on top of each other? Same results! I would think

ARS> 768x428 would be ample space for a program to display...

There is only one conclusion possible from this utterly nonsensical statement: you have never used a multitasking system.

YHS:QSI!

Why do you discount these things? Again, you just saying "XYZ Ha ha"
doesn't make anyone believe anything. I've used DTP applications on
the PC that work just fine. In fact all the major DTP programs run on
the PC, while Interleaf, Frame Maker, etc. don't run on the ST (which I
can only assume you were making the comparision with).

For Jon Q. Luser, though, I think Mac's are the best DTP systems. I
remember people cranking out the most beautiful stuff with even
MacWrite and Microsoft Word in the computer labs at U of Maryland. (In
fact, so many people from the community who weren't students would slum
off the UMCP machines that we had to consider an ID card policy. We
were going through 150,000+ pages of printing in peak weeks.) But I
digress as usual.

>Guess what? I've ACTUALLY USED ONE! Makes us users wonder where the hell you're
>living, huh? I guess you guys in the STATES really have it tough, huh? Well
>guess what? I think you guys deserve it... (most of you anyway).

Please don't say things about peoples' countries, OK? It's not nice,
and tends to really piss people off for no good reason. And given
demographics you are least likely to be correct when you generalize
about the US -- we are probably the *least* homogeneous group under a
single flag on Earth.

Yup! You got it! Lethal Xcess has lots of neato options that I couldn't
look at (I think it had STe DMA sound, or chip sound, or Replay sound)...

There are three levels of difficulty... something like "Easy", "Normal"
and "Lethal"...

The number of moving objects (without slowing down the animation or
game play) will make you _flip_... You'll swear you're on an '030 machine!

Well, I have $3,000 to spend on a new machine. With this money I can purchase a top of the line of just about anything out there yet I am sticking with my 1040 ST for now... Why? When I invest in a new computer it MUST be to the ST what the ST was to the Atari 800. I haven't seen anything do that yet although it is clear that the time is approaching... If only the Falcon were 32 MHz with a 32 bit databus... Oh well, no hurry, my ST has lasted me seven years and the SGI Indigo I have in my office kicks the butt of anything I'll end up buying so I've got the best of both worlds for now...

Answer your question?

Well, Matt... I agree there are still pirates in the Atari world.. there will be until the last Atari disk derezzes and the last Atari gasps its last gasp..
But the huge volume of Atari piracy that was rampant a few years ago has completely died off.. there's so little left to pirate that they've mostly moved on to greener pastures..
Why would any self-respecting pirate stay in a marketplace that has so few new releases..? Why would anyone want to pirate old stuff..? Pirates want lots of NEW stuff.. and that surely isn't available in the Atari market...
I think your equation was backwards anyway.. the real situation is: Dead ST = No Good Software = No Pirates.

Except that the DSP chip has its own instruction set, its own
compiler, and its own set of intended applications.

It can't do general purpose processing, it's not a "math
coprocessor", and it can't do anything to aid most programs.

The DSP can do high-speed multiply and shift operations on real-time
streams of data such as audio or video, but it's essentially worthless
for most general purpose applications.

The compilers most people have and use are likewise worthless for use
with the DSP...

Well, Al... guess you've either missed my messages about how I feel about my ST, or you've just ignored them..

I like my ST better than anything else I've ever used. In fact, I'm using it right now, even though I've got two PCs here in the same room, and several other kinds of computers available to me.

You may not care about Atari Corp, but the fact is, they're actively killing the computer you and I both care about.

When a dealer would rather sell Macintoshes than Ataris, that concerns me, because it means one less place for people to go and buy STs.

When Atari Corp makes their dealers turn to other kinds of computers to make a living, it means that all the people who might have bought Atari computers at that dealer will never have a chance to know what an ST is like...

When Atari Corp kills off another dealer, that means that the day when there are NO Atari dealers is one step closer.

You and I may know the "best kept secret in the computer world" but Atari Corp seems determined to make sure that no one else ever hears about the ST or any other Atari products. And THAT concerns me.

Our feelings on the matter are a lot closer than you know...

(Gerrit, I've got problems with your address...; anyway,
this may be of interest (how much?) to some people, so let's go:)

I'm very glad to hear Hexmines works well on TT;
v1.2 should do so as there are only added features such as scores.

Ok, I guess I'll have to modify my ad:
"These games are for STs/STEs/TTs, maybe Falcons ?"
(All this sounds more optimistic.)

>the quivalent 386sx but because it is on a 16-bit bus, it suffers from the
>same problem.

Yes but the LCII and the Falcon030 have things that are not on the 386SX. They have Video subsystems that just can't be added to a 386SX and be expected to work well. The audio system of the LCII is quite advanced as PC boards go, *and* it's intergated on the board so it doesn't suffer from the bus lag that permeates PCs. You can make up for that lag with a) CPU speed or b) LocalBus. With the speed that a 386SX runs windows, the machine is already a little anemic on power, a problem that will just get worse from on out. A computer is more than just the CPU-it's a gestalt. While I don't really like the idea of the LCII and Falcon being crippled with a 16bit bus, they at least have *something* going for them. And software for PC is being written now with a 386DX-33 being considered the norm. Would you really want to run a program *slower* than the norm. (This is basically true of the LCII now, but is definately not for the Falcon).

A side point to...the Falcon only has a 16 bit bus to the CPU, the DSP gets it's chunks on a 32-bit bus, and the Video system is primed to grab memory 64-bits at a time. So it's not "just a 16-bit bus".

1332. HELP: Mega STE or Falcon?

Newsgroup: comp.sys.atari.st
Date: 1993-01-19 08:55:46 UTC
From: mm68@unix.brighton.ac.uk
Message-ID: <1993Jan19.085546.1149@unix.brighton.ac.uk>
Source record: 211580

I have just had the most exciting opportunity. I am able to sell my Atari 520STE and can afford either a Falcon or the Mega 2 STE. Any suggestions as to which would be best suited. Are there any problems?

I want to do C programming and other (serious) applications in the main, so games are not a worry. However, I have a mono monitor, and second disk drive, which I wish to connect to the purchased machine (no probs there I think), and would like to upgrade the memory and connect a hard drive over the course of the year.

I guess this sorta thing has often been asked, so if someone has like a FAQ on it, that would be fine. Thanks.

>Mac's a good line but IBM? Hahahaha.
>

Uh I hate to rain on your parade, but the big two Mac DTP programs run
on Windows now (That's Quark Express and Aldus Pagemaker). There have been
articles in MacWeek and on Clarinet on how the number of IBMs doing DTP has
risen dramatically with the release of these two programs. Seems the
purchasing guys are just oozing joy now that they can force the artzy types
into using *their* favorite hardware.

That's why I sit going "go NeXT, go Apple, Go SGI, go Atari, go Ami.. go
Amig.. (well some things are hard to say....)". If people don't get on the
ball we're going to wake up in a few years to the bland diet of Windows
and other Microsoft products. Well hey at least Microsoft might throw
in a R4000 or Alpha for spice every once in awile....

1334. Re: Upgrading an ST-520

Newsgroup: comp.sys.atari.st
Date: 1993-01-19 09:07:56 UTC
From: Bob_BobR_Retelle@cup.portal.com
Message-ID: <73888@cup.portal.com>
Source record: 211575

Upgrading a 520ST can take one of two directions.

The first, and crudest (although possibly the most reliable) is to rely on "piggybacking" RAM chips on top of the existing RAM chips.

This method is only effective up to 1 Megabyte of memory. It also is extremely demanding, requiring good soldering skills in order to avoid damaging the existing RAM, and thus destroying the entire computer.

The second method is to buy a "memory upgrade" board. Most of these are of the "solderless" variety. These rely on the dubious methods of jamming socket pins down over existing chips on the motherboard, and hoping or praying that they'll remain securely connected.. or, of removing chips from the motherboard, jamming "daughterboards" down into the sockets, then pushing the removed chips into sockets on the daughterboards. These installations may work for weeks or months, but are almost guaranteed to cause problems eventually, as the connections loosen with movement or motherboard flexing from normal keyboard movement.

The very best memory board upgrades are those which require their connections to be soldered onto the ST motherboard, giving a reliable connection. Unfortunately, most of these have disappeared from the market, since they require some technical skill to install.

Another possiblity, and the "Official Atari Corp Memory Upgrade", is to trash the existing ST, and buy another, newer one with more memory already in it.

None of the ST line are "user upgradable" as far as Atari Corp's official policy goes..

Atari UK have just about wiped the ST from the UK publics memory. At Christmas
there were no Falcons and no TV (or much else for that matter) advertising
campaign even for the Lynx. If you are a developer they won't talk to you
unless you are working with a Falcon. Like Atari US, Atari UK would shoot
themselves in the foot but their aim isn't good.

BTW> This is not Atari bashing just the facts as seen here from the UK.
I like my ST and I like my Falcon/Sparrow but I'm depressed that I might not
be able to feed them.

>digress as usual.
>

I used to think that Mac's were the best DTP systems...then I saw some
Postscript output from some crappy sample NeXT program and I began to
understand what Apple had done to their Postscript Printing. For a follow
up course I was exposed to the output of Calumus SL on an Atari Laser printer.
Needless to say...I see Quark/Pagemaker output all the time (I work
in a Mac Lab) and the output just doen't look as "clean". I don't know
exactly what I mean by that...except that to me the difference is
obvious and I usually don't pay much attention to that sort of thing,
and I was bigoted towards the Mac when I made the judgement.

I'm just wondering what PasteUp really runs like....

1341. Fortune V1.0 for FALCON to be posted

Newsgroup: comp.sys.atari.st
Date: 1993-01-19 10:50:57 UTC
From: mppi76@cd4680fs.rrze.uni-erlangen.de
Message-ID: <1jgmehEINN5lq@uni-erlangen.de>
Source record: 211583

We proudly present FORTUNE, the first application for the ATARI FALCON 030
to be posted to archive.umich.edu.

Perhaps you have seen programs like fortune on Unix systems. Whenever
you login to the computer, the fortune program writes a fortune onto
the screen like "everything that can go wrong will - Murphy's law".

As the FALCON has unique sound features it is clear that our fortune
does not only write these cites, it really says them! So you will hear
Captain James T. Kirk, Alf and a lot of other persons telling
you a fortune of the day.

FORTUNE comes with a bundle of fortune sound files and a complete
manager to edit these sounds and texts.
The harddisk recording program that is necessary to create the samples
will be posted, too.

FORTUNE V1.0 beta will be posted (hopefully) on Januar 22.

Harald Schoenfeld
Bernd Spellenberg

P.S.: If you have any questions or comments, mail to us.

>* Craig Shore. Phone (Voice) +64 3 3852501 *
>* Email:craig@yonder.equinox.gen.nz or shore_c@kosmos.wcc.govt.nz *

Do tell. Why would that be that the ST couldn't do what the amiga
is doing? (in my definitions ST includes ST/E/TT, amiga includes
500-4000). What software/hardware differences do you see that limit
the ST from what the Amiga does in their case. Just wondering.
My understading is that it is possible (and has been done) to
connect an ST to the net "live" with TCP/IP protocols. And that it's
also possible to have multiple serial ports for multiple dial-in
lines.
What am I missing? I'm not asking what the amiga can do that the ST
can't, just why you think that the ST can't in this scenario.

>if my experience is any indication, Gadgets by Small won't be much help.
>Does anyone else have anything to add?

I have had similar experiences with non support.

I bought my Spectre GCR from a net user last Feb or March. I fiddled around
with it for a while and could not get it to write Mac disks. I have both an
internal and external drive and neither worked. Later last spring I bought
a 4 meg upgrade through the net for my 1040ST. The Z-RAM upgrade was very
unstable. It did not fit tightly enough in the video shifter socket on the
1040. THe appropriate fix is to replace the crummy, cheap socket that comes
with the 1040 with a good one. (I'd go for a gold plated socket with the
circular contacts; the ones that would grip the pins from all four sides.)
Recently, I removed the socket and simply soldered the RAM upgrade to the
mother board. It seems to work better now.

I FAXed Gadgets a description of my problems and got a return about 6 months
later. In June, I talked to Dave at an Atarifest in Milwaukee, and asked
for help. He said I should upgrade my software. (Mine was 2.4, 2.6, ?)
I sent in the upgrade with a check for $20. I heard nothing and still have
not received anything. I don't think they ever cashed my check. Last Fall
I finally sent in a registration card, thinking that was what they needed
to send me the upgrade. I am extremely disappointed and cannot recommend
anything from Gadgets because of their crummy service. For a long time, I
thought he was simply waiting to send my uprade for a new version of his
software but that does not seem to be the case.

Well, just because one (your) program doesn't run on the Falcon and
runs on the TT you can't conclude that the Falcon is less compatible
than the TT! What resolution did you use on the Falcon? If you used
eg. Line-A, you can't handle more than 4 bitplanes!
The only problem I've found with my programs (during the Atari Fair)
was that it seems that Atari changed some MFP interrupt priorities,
and a little demo (using rasters and VBL) worked on the older Falcons
but not on the newer ones...

I'm not convinced that the docs are the be all and end all though.
It seems suspicious to me that they've been released now and not earlier,
makes me wonder about their future lifespan. If I remember correctly, the
info was all ST specific, no STE,TT stuff, would there be falcon stuff? Ha!
And what about multitos? I doubt that'll be covered - no you'll need to
wait 7 years before you can get hold of info on that. Is it still worth
100 quid?

Most people agree that "multi-tasking" is the _apparent_ simultaneous execution of programs through time-slicing. I call what you're referring to as multi-tasking "true parallelism"

>You can't do this without a chip to do it, or without halving the
>speed of the machine for each extra process! (e.g. every program
>you wish to multi-task!)

This isn't exactly true. You don't halve the speed of the machine for each process, since one process can run while another waits for I/O, goes to sleep, etc. etc.

A friend of mine bought the Domark Championship Manager while staying in England. For easier transport he threw away the box and took disks and manual back to Germany. There he discovered that the copy protection requires you to enter some data from the box, which he doesn't have. Domark didn't answer his letter, so could anybody here help out?

At the moment you can get Mega STe's fairly cheap with harddrives, and they're easily upgradable to 4Mbs and new TOS chips (though watch the warrantee!), but obviously the Falcon is the Atari future with good graphics and all that... It depends on budget and whether you want it NOW!

> The RESPECTABLE dealers around here discourage SX purchases; some even
> REFUSE to sell SXs. So, who cares how little they cost. After all,
> you can get a great deal on a Commodore 128 as well!

Nobody's been saying "buy a '386sx"... We've been saying, "Hey, look...
With a monitor, the Falcon030 4M/65M costs as much as a Mac LC II 4M/80M
or a '486sx/25 4M/100M... Hmmm."

The '386sx is just like the '030 in the Falcon... A 32-bit processor
hampered by a 16-bit bus.

1355. SX dog-days

Newsgroup: comp.sys.atari.st
Date: 1993-01-19 14:00:56 UTC
From: csullogg@cc4.crl.aecl.ca
Message-ID: <19JAN93.09005656@cc4.crl.aecl.ca>
Source record: 211598

kevin K. asked me to describe why the SX CPU is a dog. Here goes:

The SX was meant to keep the cost of upgrading from a 286 to a 386 system to a reasonable cost. At one time, the cost difference (CDN$) between an AT and a true 386 system was $500-$600 on average and could be as much as $1000. The SX CPU brought that difference down by a factor of about 2.

The SX, being a 16 bit external and a 32 bit external, plus its design meant that it had to have two write cycles to the bus. Therefore, if a person had an AT @ 16 MHz and an SX @ 16 MHz, the SX actually ran SLOWER than the AT. For example, the AT would Landmark out at about 21-22 and the SX would Landmark out at about 15. So, if a person bought a 16 MHz 386SX, he actually got poorer performance than a 16 MHz AT. A 20 MHx SX system would give about the same performance as a 16 MHz AT.

THAT'S WHY THE SX WAS A DOG FROM THE BEGINNING.

Anyone who wants to buy a 33 MHz SX system SHOULD NOT!!!. The price difference to a real 386 is small enough that a person would have to be crazy to get the SX.

Hope this helps.

|> >> BTW: anyone know why GEM does that sometimes???
|> >>
|> >> Craig
|> >

When I read this I remember something I found out some time ago. This bug is depending on the length of the program's file specification (that is, including folder, such as "A:\AUTO\SEBRA.PRG"). If the file spec has a particular length, this bug happens (sometimes). So, to cure it, you just change the program file's name (to another length), and you should get rid of your problems. I know this happened on my Swedish TOS 1.62, but my (also Swedish) TOS 2.06 doesn't contain this bug.

Since I no longer use TOS 1.62, I won't bet my life this works (but I'm pretty sure and it's quick & simple). There *should* be some bug fix around, somewhere, by someone... 8)

Careful! Atari refer to those versions as 1.4, and 1.2 not 1.04 and 1.02!

(As long as you are understood it's not a problem however 8-)

Don't use a TOS version lower than 1.4/1.04 with a Hard-Drive, or it
will be *slow*!

(Without any patches, it takes all day 8-(

I think you got that wrong!

Most posts here are by people that either own _both_ or own an ST
and know some _facts_ about the PC.

Most posts are also not trying to convince you to buy a PC, they're defending
the PC against all the bullshit posted by some ST users that obviously
have never had any close contact with a PC, but go on flaming it like
they own one as well.

>What I fail to
>understand is why most PC users feel motivated to spend time reading Atari
>posts and actually respond in derogatory and insulting fashion trying to
>convince atari users that they are stupid, misguided and in need of superior
>wisdom.

As I said, I haven't seen any PC only users here, they're duel users (they
have both) and they're maily defending the PC against lies.

BTW: I only own an ST. I stick up for the PC as I don't have any favourite
computer that I love and will defend until it's death. Anything reasonable
will do for me. I just wish my ST's software was up to scratch... never
mind, one day i'll get around to learning C.

Craig.

The 19200 colour mode (96 colours per line * 200 lines) from 32k colours is absolutely fantastic! If you haven't see it then find someone with an STE and be impressed. At last my STE can do something my mates A500 can't !

I have only two gripes with PhotoChrome 3 and that is it doesnt handle IFF files as well as it does GIF files (ie no squash to fit or display area selection) and it can't as yet do JPEG files :(

This reminds me, when I was doing a co-op term a couple of years ago at the Dominion Astrophysical Observatory, they were using STs as vt100/Tektronix terminals for their Sun server (they weren't using Uniterm, though...I think the programme was called VT650). I'm not sure there are many left, at this point, as they were slowly being replaced by Sparcs.

Just a little Atari trivia...

If they wanted to be competitive with NeXT and Mac Quadra that is...
Then obviously they'd have to be comparatively priced...

I don't think that's Atari's intention. They wanted to make a machine
that the average joe would buy. The average joe does not buy an '040
machine (at least not the ones I know).

Look at Tandy; they were by far the largest clone seller even before they
made a '486. They sold to the average joe.

Largest computer manufacturer in the world? Hmm, could you tell me where you got that interesting snippet of info? Do you use an "IBM" product? (NOT a compatible) In fact, isn't it true that compatible makers pay nothing to IBM? (Or at least, next to nothing - but I'm pretty sure it's nothing) As for its "folding", have you seen the losses IBM are taking? They're RISC market is close to dead. They're PC market is so bad, they had to release a "pure compatible" (ie Ambra). They had to lose x hundred thousand jobs all over the world just recently. Why don't you put all this into your .sig? Then again, its pretty entertaining to see a "compatible" user who doesn't even know the current business status of the company that he's supposedly supporting!

Yes, I bought my Mega STe there a year ago. It was not a bad experience
by any means; I got a great price, and they were very flexible. I found a
place in Computer Shopper that had cheaper hard drives and SIMMS, so I got
just the CPU from Carter, and the Atari HD installation kit, with no problems.

I don't doubt at all that the Falcon is a good computer.

THE FALCON IS A *_GOOD_* COMPUTER

there you go, I said it.. happy?

What I do doubt, is your knowledge. You sit here flaming the hell out of
the PC in which probably 50% (just a wild stab in the dark, no facts to
back that up) are based on mis-information, or your assumptions.
All we're trying to tell you is that _BOTH_ computers are good.... you give
the impression the PC is a piece of shit... which it definetly _is not_.

At the moment the main advantage the PC has over the Falcon is that
you can buy it!, and you can buy it cheap.
The Performance difference is not that significant when comparing the
availability, service, extra's, and COST for a lot of users.

>They're still guarenteed the same, 1 or 2 years (depending on the part
> you're talking about), so if it busts, get it fixed or replaced
> for free.

Unfortunately, computers aren't like cars, despite the silly analogies
I've been hearing lately. With cars, if everything works fine in the
first two years, nothings likely to suddenly fail for another ten.

But with computers, a flakey component can work PERFECTLY for any amount
of time then DING - suddenly a chip pops out of its socket (ok, easy
to fix). Or a dry joint finally develops just under the spacebar that
you bash everytime you fire a smart-bomb.

So, while this doesn't have much to do with "advocacy", it's worth
considering when comparing warranties.

Source record: 211514

Okay, so, we've established that a lot of people like Lethal Xcess
(I want it.... 8-(

Has anyone seen/played/purchased 'Amber-Star'. Which is the latest
Ultima/dungeon master clone. (But better than Ultima 6). Looks
very nice. But how does it stand up!? (HD installable, which is
good!).

How about people reporting on some of the more recent games that they
have bought, or acquired. (Or even, just played.... etc.)

I had a look at a friends Super Space Invaders. (oldish, but not bad),
which is a mega-souped up version of (you guessed it), space
invaders. Nice graphics. An incredible intro', and end-game
sequence (resembling Don-Bluth type games like Space Ace, with respect
to animation etc.). And good title music. The game itself is basically
space invaders, with pick-up powers, different attack forms, mother
ships here & there. Two player at-once mode. Good clean graphics
and sprites etc. Not bad at all - not very easy either!

Also, No Second Prize. This is a motor-bike racing game, with VERY
high-speed 3D graphics, mega-smooth scrolling etc. The game itself
has a lot of varied tracks. Enough to keep most people happy for a
while. A pretty good introduction sequence. A replay-mode,
(replays the last 20-seconds, from various view-points). You can
select various people to control, all with different skills etc.
The aim of the game is (to win) to complete all tracks with the
highest score, and win the classic-bike that the yuppies (who you
play) have been racing against (and who you control), have pooled
their money together to buy, and must decide who keeps it by holding
this mini-season race!

This famous Paradroid 90 game, for anyone who hasn't seen it. Is basically
a shoot-em up. With a bit of strategy thrown in! You control a
influence droid, with weak weaponry, and virtually non-existant
armor. You can take over other droids 'minds' by getting close enough
to link circuitry. You can either make this automatic, or have a
sub-game to compete against the host droid to see if you manage to
take it over. The aim of the game is, to destroy all the droid on the
ship, by using elevators, rechargers, taking over some of the many
assorted droids (from the cleaner droids, to the master combat droid)
and eventually clearing the ship of the gone-haywire droids, and
proceding to the next ship. (a total of 3-ships from memory, you can
start on #1 or #2!!) This game has suitable graphics, and is VERY
addictive!! (I thought so anyway). It has a lot of different bits
'n' pieces throughout the game you can use to your advantage (like

blowing up rechargers with a droid still in them, which blows them
up due to the power released - blows both up that is....) USe
the computers to find out what decks you have to 'clean'. and get
information on the other droids etc.

Great - classic - game!!!

1383. Spectre GCR: Knowing What To Do

Newsgroup: comp.sys.atari.st
Date: 1993-01-21 01:10:30 UTC
From: mrz5149@ritvax.isc.rit.edu
Message-ID: <1993Jan21.011030.23808@ultb.isc.rit.edu>
Source record: 211515

Ok, recently I've seen confused folks posting about their problems with Spectre GCR. Well, I'll try and help you folks because I had some of the same problems when I started out with Spectre (thank God for technichal knowlege!). Just to let you know, yes, it really works. Right now I use Spectre on my Mega STe and it works perfectly fine.

Clearing up problems:

1. Why won't it read my disks?

I occasionally had this problem at "random" intervals myself. I eventually found out that when Spectre didn't read disks (Mac or Spectre) I had booted up my machine from the hard drive without a disk installed. To solve this problem, I put in a disk with a virus protector (a nice bonus) and just boot up with it there every time I turn on the computer. Simple. I think the reason for this is that the STe seems to ignore floppys when you don't have one in the drive when you boot. This may not be true for all machines but it works on mine.

- Also, Spectre DOES NOT handle 1.44 meg disks. Dave has stated this himself before. Also, if you are a 1.44 meg disk user, boot with a 720k floppy as stated above and don't access a 1.44 floppy before you boot spectre (if you do, access a 720k disk) this ensures that the disk controller is not in 16 MHz mode.

- Another problem that crops up is the inability to read Spectre disks. The Mac mode system says "This disk needs minor repairs" I think that this may have to do with certain CDEV or INIT files you use in Mac mode. This problem only cropped up recently for me, so I'll see if I can find a fix.

2. What's my version? What's wrong with it?

You NEED the following versions of stuff:
* Spectre 3.0 or later (earlier versions are too buggy to work with current mac software not to mention they don't have good sound support.)
* System 6.0.5 and the Finder to match. DON'T use 6.0.7 or 6.0.8 or 7.x.x Spectre is only compatible with 6.0.5 so far. The others might boot up but they will only cause headaches. Don't mix 'n match Systems/Finders.

3. Caching and the Mega STe/TT.

I'm not sure about the TT but the same idea should apply to the TT. You must keep the cache off on the Mega STe but you can kick it into 16MHz non-cached mode safely. (TT users, the idea is to kill the caches unless they are on board the Microprocessor). I think the idea behind this is that the Mega STe reserves a portion of memory for instruction caching and the Mac software crashes right into it (why should the Mac care about STe reserved

memory that it thinks isn't supposed to even be there). Actually, I have used the cache with mixed success. However, if you want to use cached 16Mhz mode on a Mega STe you MUST have a full 4 Megs. Then select the 2.5 megs of ram from the memory configuration menu in the Spectre main menu. This seems to work but sometimes, the config makes the system do flaky things so if I'm really desparate for saftey (like when typing a paper) I go back to non-cached. Oh, if you try to use the cache without 4 megs, the machine will crash, guaranteed!

4. Spectre Disks/Mac Disks and the Transverter.

To format a Spectre disk you can use the formatter in the Spectre main menu or use DC Format using the following settings:
9 Sectors per track, 80 sectors, seek rate of 2 ms (2ms is important!).

- Note: The transverter will NOT read HFS (Mac) disks or HFS (mac) hard drives. Only regular Spectre disks. Kind of cheesy, huh? Well, I think so too. Wait until the next version. BTW, I've heard Mac See has plenty of bugs. Whatch out.

5. Dave is just ignoring me!! (or is he)

Give the man a break. He is running a sing person runned buisiness. He used to give good service when he was just living off Spectre alone. He is now entrenched in tons of projects including wading through the tons of code in the color Mac ROMs, working on the newest Spectre GCR version, the Falcon GCR, the Chromax board, etc. This is straight from the horse's mouth so to speak. If you don't belive it, read his article in Current Notes. So give the guy a break! It's just him, his wife and his kids. The man has guts to do such a job practically alone!

6. Any more questions?

If you have a question I didn't answer here, drop me a line in my computerized mail box. I've been using Spectre for a while, so I prob. have the answer to your problem. However, try not to flood my mail box, it is a bit full so make sure the question is in dire need.

7. Woops, I forgot color.

BTW, don't bother using a color monitor. Spectre is virtually useless in it. The solution to this problem is to buy a multisync monitor or a monochrom monitor. Sorry.

>compared to the speed and convenience of a typical hard disk. I think they
>would be great for backups but not ideal for your primary storage device.
>This is IMHO and others here may voice different opinions, of course.

They are a whole heck of a lot faster than floppies! I can copy a 200,000 byte file in just one 1/2 second read! Not as fast as a hard drive, but it's no VW like you make it sound! s-l-o-w is hardly the word I would use...I would say F-A-S-T...consider the medium...if the motor didn't have to get up to speed it would be almost as fast as a hard drive, I know, I have one! With a good buffer, like the one with ICD Link, it can do all the repeated writing and reading at once, so it doesn't have to get up to speed, making it even faster!

As it sits, the only wat the Atari could do this is if someone did some serious MiNT hacking. While we had multiport serial cards from Double Click, and I have heard there may be a few VME ones available, there is no port of b or cnews, much less INN. You would need MiNT drivers, a working cron for MiNT, and a different file system , especially if you were going to provide shell accounts.
It would be considerable easier to do this under os-9, where I've heard there are cnews and rn ports, but I don't know if they have a TCP/IP driver, or multi-srial port driver.
While the ST and TT are physically capable of it, the interest in porting and setting up such a system is obviously not present.

>The Falcon will display all three ST resolutions on whatever monitor
>you happen to have plugged into the thing!
>
>(It interlaces or something like that to get the 640*400 for ST-High)

On an SC1224 (or TV or similar display) it will use interlace, on a VGA
monitor it will be displayed directly (noninterlaced).

To tell a program that it's in ST-high rez when it really isn't would be
rather silly, particularly if the program then proceeds to write all over
the screen under that assumption. (The results would be pretty colorful,
though...)

The Falcon demonstrates yet another reason (that many folks have been saying
for years already) not to write directly to screen memory - the true-color
mode isn't laid out in memory the same way as the other modes. So even though
I have a set of routines that correctly handles an arbitrary number of
bit-planes in the usual ST layout, it draws garbage on a true-color screen.
Quite the drag...

NOTE: Craig can only be talking about SHAREWARE/PD games off THE NET,
since almost all commercial floppy-only games boot automatically.

Dave Badgered games are pretty good I agree, but all that is required is
for the programmer to use paths like "data/foo.pi1" rather than
"A:/data/foo.pi1". No hard, really. Reason? Who knows - I don't - who
here posted that "attitude & compatibility" article? They had the
reason perhaps.

>I saw some messages recently about a CLI called Okami in the fidonet
> atarist echo saying that it was the best.
>(I've since got in touch with the author, who kindly mailed me a copy
> of the latest version. It should also be on a.a by now.)

Okami has some very good features. Since I'm still working on a slow
8MHz ST, I need a shell with things like "ls" built-in, so MiNT, tcsh,
ksh, bash etc, are unrealistic for me at the moment.

Okami, Gulam, and Mupfel all have built-in things like "ls".

Okami and Gulam have control-flow commands like "if" and "while",
Mupfel doesn't.

The big trouble with Okami (in fact, the real reason I don't use it)
is that it doesn't expand wildcards. For example:

mup> zoo a foo.z *.c

works under Mupfel, because Mupfel expands the "*.c" into the list of
files. Okami on the other hand, does not - it does as DOS programs do:
assumes that the program itself will expand the wildcard.

One useful point thought that the author of Okami indicated to me
was that you could force woldcard expansion by using Ctrl-Esc.

A second problem with Okami is that it cannot really be used under TOS,
since prssing Control-C while an internal command is executing (eg. ls),
cases okami to terminate.

A third is that Okami does not yet use ARGV argument passing.

Probably the best thing about Okami is that the author is still
working on it, whereas Gulam is no longer supported. Mupfel is
still supported, but is severely lacking in features.

However, Mupfel is what I currently use.

Anything that lets me type:

```
vi *.[ch]
make
vi *.[ch]
make
vi *.[ch]
make
vi *.[ch]
```

```
make
vi *.[ch]

Will do for me :-)

Who here uses "zoo"? "lzh"? "arc"?

All of these applications could benefit immensely from a DSP-based
implementation.

>The DSP can do high-speed multiply and shift operations on real-time
>streams of data such as audio or video, but it's essentially worthless
>for most general purpose applications.

There is nothing to stop your "real-time streams of data" being a
zoo file, or lzh file.

Another great "real-time streams of data" is the analog phone-line
audio. By emulating a modem, the DSP can implement any of the
current modem standards - all in software, with just a simple
device to actually make the external coinnection to the phone line.

>The compilers most people have and use are likewise worthless for use
>with the DSP...

Many people use GCC. There is a Motorola-supplied Free port of GCC
to the DSP56000.

Steve Wells writes:
[A lot of good applications for a Digital Signal Processor]

Except..

>Co-Processor. Programs should be able to use it as a secondary processor
>to speed up a lot of operations. (e.g. A MUCH enhanced blitter etc.)

A DSP has a VERY limited instruction set, highly optimized toward
multiply and shift operations, the kinds of things you'd want
to do to a stream of real-time signals (ie: audio or video)

It CAN'T do the things a math-coprocessor can do, so its use
as a "co-processor" would be extremely limited.

It would be almost worthless as a graphics blitter in addition
because it has a limited memory space available to it, and has
no direct access to video memory. All I/O would have to be done
over the bus, ie, too slow for much use as a graphics blitter.

>Parallel processing (ahem 8-) Running (from memory) 3 processes in
>parallel (at the same time). Giving high quality multi-tasking
>capabilities if it's used correctly!

Only if the process (DSPs don't multitask, it would be pointless
on a chip designed for highspeed manipulation of data streams)
was something useful. If it was doing something like processing
video data while the main CPU ran something else, it could
be called parallel processing, but you couldn't do anything like
running two general purpose programs in parallel.

(DSPs could of course be run in parallel, if the computer was
designed to handle more than one.)

All the other applications mentioned would make good use of
the specialized power of the DSP.

>reincarnated character (DM only, I think Chaos Strikes Back would be
>impossible like this, though I could be wrong!). Try completing in
>minimal real time (DM takes about four hours, maybe less for all I
>know. No idea what Chaos Strikes Back takes).

All *very* good ideas..!

Other things to try.. take a party through the game using
Magic only.. or try using Fighters and no magic..

(And if you're a REAL Dungeon Master "Champion", you'll know why
those ideals can't be reached... though it's fun to try.. :)

Just for fun, I recently started a new party, and went through
the first six levels without using any weapons... it's VERY
interesting trying to kick Purple Worms to death..!
My characters were all pretty high level Ninjas by the time they
got to Level Six... (Had to use magic though.. kicking a Wasp
to death is no fun, and the "Green Ghost" banshee on Level Four
can't be touched without magic...)

And yes, Chaos Strikes Back can be won with just one reincarnated
Champion... "Raalf, Bad Dude of Romulus" (a Detroit area "inside
joke") had some bad moments all alone there now and then, but
in the end, Balance and Good were restored to the world...

Dunno about speed... knowing where you *have* to go, and where
you can avoid going would help a lot... although that also
results in much weaker Champions from having less combat
experience (though if you know enough about the Dungeon to
avoid places that aren't necessary, you'll probably know enough
to keep your people alive, even if they're weaker..)

I played through the Amiga version of DM one Saturday and Sunday,
but I had to go down *every* corridor, and fight *every* monster
to be sure that there hadn't been any changes (FTL wouldn't
tell me, and I had to know if my hintbook had to be changed for
the Amiga release..), so I didn't set any speed records..

Probably the *most* fun though, is to play through a Dungeon
that's been modified... it all *feels* familiar, but the
corridors don't all connect in the familar way.. just when
you think you're safe, a Purple Worm comes wandering up a

tunnel that didn't used to be there...!

(Yup.. if I had to choose only one program that would continue
to run on my ST, I'll bet you could guess which one it would be)

:)

>clone is NOT an "upgrade"? You're willing to admit that the only "upgrade"
>a computer system is the replacement of the CPU?

Plugging a device into a port on a computer is NOT an upgrade.

Plugging a modem into an serial port is NOT an upgrade.

Plugging a printer into a parallel port is NOT an upgrade.

Plugging a monitor into a video port is NOT an upgrade.

Plugging a joystick into a game port is NOT an upgrade.
Plugging a cartridge into the ST's cartridge port is NOT an upgrade.

Inserting a sound card into a PC is a sound upgrade.

Inserting more RAM chips or SIMMs is a memory upgrade.

Inserting a better video card is a video upgrade.

Inserting a high density floppy controller is a floppy upgrade.

Changing the motherboard to utilize a better CPU is a system
upgrade.

ALL "PC" systems allow the above "upgrades".

NO "ST" sysems allow the above "upgrades".
Ask Atari Corp. if their ST systems are "user upgradable".

>As I said, I haven't seen any PC only users here, they're duel users (they
> have both) and they're maily defending the PC against lies.

That's an interesting comment..!

People who own just PCs have far better things to do with their
time and computers than come here and try to evangalize Atari
owners...

They do things like Desktop Publishing, Word Processing, Graphics
and Music, Business Applications, and even Games, on their PCs...

If you read any of the PC newsgroups, you find people who are
busily and happily using their computers, instead of fighting
over the remains of a dead software company, or trying their
best to defend the bizzare business practices of the company that
manufactures their computer. (Or discussing how great it will
be.. someday.. when the new _________ computer is finally
released... someday...)

PC owners don't much care about the Atari world.. if they even
know it exists...

It's Atari owners who exist in more than just the "Atari ghetto"
who seem to rub the "Atari religious" the wrong way...

"The Truth" is not welcome here...

Did you ever read any of the coverage of the 520ST when it first came out?

Cover stories in Byte magazine, Creative Computing.. features about how the "Jackintosh" was going to bury all the other kinds of computers.. Articles about how MicroSoft was going to port all its Macintosh applications to the ST (Atari people said so, so it must have been true), and how Atari Corp was poised to take over the computer market with its amazing new, cost effective ST computer...

And then... and then... and then, nothing happened.

Atari fumbled, and didn't recover...

And the magazines went on to other, more realistic kinds of things.

(I still have those 1985 issues with the STs on the covers.. pretty sad.)

No.. Atari Corp needs to do something, as soon as possible.

With new products, new software, new applications, new information,
there wouldn't be any need for an "advocacy" group..

There'd be so much chatter about all the great new products and programs
that you couldn't get a flamewar in edgewise...

Who would want to waste time arguing about silly stuff when there would
be great new applications to discuss..?

Think about this... ONE new Atari dealer opens in California somewhere,
and it's a world-wide media event... that's pretty sad..!

One thing that everyone seems to be missing here is that there ALREADY are two separate Atari newsgroups...

comp.atari.tech is where all the "nitty gritty", "informative" Atari discussions take place.. its mandate specifically precludes any kind of "flame wars"...

If you don't want to read discussions about how Atari computers compare with other brands of computers, then don't read the "general" newsgroup..

Otherwise, it's "Open Season" for anything and everything...

Both of those are good for some circumstances. If you dial in
to a Unix system on a regular basis, use the ST Unix Windows client.
It lets you open several terminals at one time and takes better
advantage of the Unix system. The only problem is if you have a low
bandwidth modem, one window producing a lot of output will make the
others really slow. The client and server side of Unix Windows is
available through anonymous ftp, but I don't remember what sites right
now. I've only run this on my 1040, so I have no idea if it works on
newer Atari machines.

Yea, It was basically useless with only 2 megs of ram, but with 4 megs it has no problem running system 7. (Also, if you upgrade, I found it to be cheaper to mail-order the ram and then take it to your local authorized dealer to have it installed.)

> To my opinon, Sys 7 doesn't seem fast on *any* Mac. I don't quite know what

I found it to be too useful to stay with 6.0.8. (Which is what I used when I only had two megs of ram.)

Well, STig,
I'll tell President Clinton to stop the bombing because you want
to buy a new computer. I'm sure he'll see that your new Falcon is
much more important that forcing Saddam to comply with the treaty
Iraq signed at the end of Desert Storm.

The following has nothing to do with computers but:
I participated in NATO exercises in Norway during the mid/late 70's
when I was in the Marines and have to say that I think that
Norwegian women are the most beautiful and healthy looking I've ever seen.

>you wish to multi-task!)

This is a use of the term `multi-tasking' with which I was not previously acquainted. In fact, the entire field of Computing Science is not aquainted with it. You are describing multi-processing. Have you considered taking a few CS courses? Just basic survey courses would be helpful, by the sound of your posts. They're easy credits; you know, `hacks for jocks' (apologies to geology's `rocks for jocks' courses).

BTW, multiprocessing with heterogenous processors is generally not much good in general purpose computing environments. It gets too difficult to optimally distribute the threads of a job when they're architecturally dependant. All the really whizzy multi-processors are homogenous; for instance, big Crays and the Connection Machines.

Now as regards the claim that the DSP chip is a big performance enhancement -

The idea that you can get big gains *in the general case* from specialized hardware is often referred to as "Pike's Inequality", and has been tried (and subsequently abandoned) repeatedly in the history of computing. Spending the transistor budget on the CPU(s) always seems to win out. Come on over and lurk in comp.arch to get a feel for the issues.

On the other hand, I cheerfully agree that special-purpose machines (simulators, controllers, dsp's, games boxes, & c) can get useful boosts by optimizing their architecture for a restricted problem domain.

regards,
Ross

>
> Thanks to the Tramiels.

That's not entirely correct, and somewhat over-generalized.

Any peaks Atari had over its entire history have been mild. Ever since Bushnell left the company it's been on a spiral down the tubes. Do you have any idea how many CEO's Atari had between Bushnell (late 70's?) and the Trameil's (early to mid 80's?) I read a case study in my Principles of Management class a few years ago, and I seem to remember about 4 (give or take one). One of the later CEO's was imported by Warner from the _textile_ industry! Unless you can think of a way to make a solid company out of practices like this, you should probably thank the Tramiel's for buying Atari and not letting it go straight down the toilet like Warner was!

If you want to criticize Jack Tramiel for not running the company in a 'perfect' manner, you probably can, but remember, and think how much more Atari is exposed to their customer's (yopu and me) critical eye more than say IBM or ANY of the clone comanies, or the Apple Corp. Maybe Atari should takeon practices more like Apple and company, and keep us more at arms length so they could work out their problems without all of us knowing every little detail. I personally can't find a legitimate way to criticize them much, as, Jack Tramiel's and my positiopn were reversed I would probably do thing with just as much apparent logic.

Also, as far as the microcomputer market is concerned, I don't think there is _that) teremendous of a difference between Atari's future and IBM's. (The key there is what market I am talking about -- IBM does business in MANY other markets than that of the microcomputer!) I really don't think the current 80x86 line can be considered to be a large part of their future due mostly to the clone market, so they will not have so great of footing as one might think. This will make Atari, Apple, and IBM much more competitive with each other. I think it will be very similar to how it was in the mid-80's, with the exception that Apple will obviously have a much larger share of the market than it did then.

There is also another program which I have started to use recently,
called MTT10 by Stephan Baucke. The program and documentation are
in German but the program works very well for me.

It fits very nicely into a TOSWIN window, and although it doesn't
provide any fancy terminal emulations, it's good enough for me to be
able to post this message while looking up the name of the
program's author in another.

Don't be put off if you can't read German - MTT's configuration file
example (the DEFAULT.MTT) is pretty easy to interpret.

It also comes with zmodem built-in. This can be set to kick into action
the moment you request the remote end to begin transmission.

1423. Recommended Falcon monitor?

Newsgroup: comp.sys.atari.st
Date: 1993-01-22 22:02:58 UTC
From: selick@csa.bu.edu
Message-ID: <108007@bu.edu>
Source record: 211458

What is/will be the recommended monitor for the Falcon (if/when it becomes available to me) to be able to use all of the screen solutions in all of the colors, and in a reasonably crisp manner? I'm hoping that the answer isn't a $1200 monitor from Atari (the price I'm hoping the Falcon will cost with 4 megs and a 65 meg hard drive). Will there be support for other lower cost monitors that, perhaps, the IBM community has been using for years and I might find used for $3-$400 US? Also, they (Sam Tramiel in Boston in October) said that the Falcon could display sm124 monichrome mode on a color monitor. Is the SM1224 acceptable for this, or are they speaking of some $600 multi-sync monitor? I'd like to sell (not now, but when I'm looking to trade in for a Falcon) my 1040 ste w/4 megs, an sm124, and a sc1224 to pay for the falcon & a monitor. What will this system be worth when the falcon comes out (speculations, of course) and what would I get for a used Supra scsi host adaptor? (Assuming, of course, that I won't need one with a falcon).

1424. EPSF files and Pagestream --problems

Newsgroup: comp.sys.atari.st
Date: 1993-01-22 22:47:23 UTC
From: komives@lamar.ColoState.EDU
Message-ID: <Jan22.224723.71012@yuma.ACNS.ColoState.EDU>
Source record: 211457

I just confirmed a problem that I thought I had. I can't get EPSF files made with Pagestream 2.2 to import and print in Pagestream the way I could with 2.1.
I have an old template that has an EPSF file embedded in it made with 2.1. It prints fine in 2.2. That old EPSF file also imports and prints correctly in new documents.

New EPSF files appear to import correctly but when I print I get nothing .

Both the EPSF files made with 2.2 and with 2.1 print when I just send them to my postscript printer from the file selector.

I have tried puttin "EPS" in the special text box in the printer config. menu. I have also left it out. In both cases I get the same null result.

Any ideas? E-mail (or post if you think this is of general interest).

1425. Re: Why Atari can't succeed in the United States

Source record: 211463

Jon,

I don't understand. Could you please explain your reasoning behind your statement that the Lynx puts Atari on firm financial ground?

Perhaps you haven't heard that Toy R Us has dropped the Lynx? Maybe you didn't know that Toys R Us was Atari's biggest purchaser of the Lynx? Toys R Us has over 35 percent of the toy market; the toy market is a multi-million, if not billion, dollar a year product market. And Atari lost this major business account.

Because Toys R Us dropped the Lynx, their competitors don't have to carry the Lynx any mor; and this is exactly what is happening. Babbages, Eletronic Boutique, Kay Bee Toys, etc, have cut back or stopped handling the Lynx.

>running two general purpose programs in parallel.

Actually, I think this is what is generally refered to as parallel processing, though as the dsp is a different chip for the main processor, I would guess it's more accurately co-processing. With true parallel processing computers, like the ill-fated ATW, the main use is for pipelined operations, where one processor can have an operation running with the output data fed to another processor.
The dsp will hopefully be used for all kinds of interesting applicatioons, but the limited instruction set seems to rule out things like compilers, word processors, and other common operations. Possibly it might be useful for recalculating large spreadsheets, though most spreadsheets tend to involve floating point math. I haven't done a lot of floating point to scaled integer conversion, so I don't know if the dsp would be useful for speeding it up or if the overhead of converting would outweight the speed up from using the dsp.
3D virtual reality software could benifit enormously from the dsp, but if the machine slows down as much as is reported in the true-colour mode, then the limited resolution of the lower rez modes would make the Falcon more of a hobbiest level machine for that. That fits in well with it's target market, but I wouldn't expect to see Terminator IV graphics done on it.

Another pair of great games for the ST are Captive and Knightmare, though Knightmare suffers from appearing to have been shortened at the last moment and rushed to market. However, you could ensure you never needed another game on your ST by actually trying to finish Captive. I think it would take somewhere in the neighbourhood of >90 years, as I have heard the program will generate 10,000 levels.

Does anyone know the fate of Captive II, as Mirrorsoft was the distributer, and Zenobot's game list doesn't show Captive II as being picked up by another distributer?

They are decidedly not slower than floppies. ICD's Ratehd reports 120ms
seek time and 99kbs data transfer. No way are the hard drive manufacturers
quaking in their boots about this performance, but its not all that bad.
If it will give you a better feeling for the speed, I could copy some
files, run a database sort, etc. and compare the times to a Syquest.

From: gt1448b@prism.gatech.EDU
Message-ID: <81425@hydra.gatech.EDU>
Source record: 211468

I recently bought a Sony CPD-1302 multiscan so for the first time of my Atari ownership I have high resolution capabilities. I have been using monochrome often and have noticed that on occassion the screen will shift to the left and have 7 vertical black lines evenly spaced accross the screen. This will go away after a reboot or a few minutes. I turned off the monitor, waited a few seconds, then turned it back on and the display was the same. So I assume it is not the monitor but the Mega STE. Is this a known bug in the Mega STE?

Somehow I doubt that what you call really good is at all related to
what I do... in mono you can probably get a fair font at less than
8x16, but that 8-bit width just can't be shrunk much.

> and if you have a halfway
> decent screen accelerator (NVDI or Warp9) it will pretty well keep up with
> 9600 on an ST, something that Flash doesn't seem to all that well.

Sigh. Why do people say stuff like this? Right now I'm using vi through
Flash 1.6 at 19200 baud, and screen redrawing is excellent. I also
use Quick ST, which I hear is not as fast as Warp9. BTW, I tried STalker
with the same Quick ST, and it was still the slowest vt100 emulation
I've ever seen. Do you even use vt100 termcaps on a Unix system?

> If you only have an ST, use Uniterm, you don't have the speed or need for

> CoNnect, which is as close to flawless as I have ever seen a
> terminal emulator get.

Does it have an editable capture buffer with word wrap? Is it as fast as Flash 1.6?

I get the feeling a lot of people use term programs to just dial up bulletin boards in TTY mode, without ever using a real editor or something that requires vt100, and then telling me about vt100 emulation.

In article <743@vercors.frec.bull.fr> heritier@delta4.frec.bull.fr (Franck HERITIER) writes:
>Does someone know what is M-ROS for Atari ST ? What is the editor
>of this multitask system ? Can you evaluate it ?
>
>Thanks.
>
>Frank.

M-ROS is the multitasking environment developed by Steinburg-Jones for use with their MIDI software.(Cubase, editor/librarians, etc.) It also, I believe, allows communication between various components of Cubase itself and between Cubase an other programs that would be running simultaneously. (Midi data exchange, triggering, events, etc.)

M-ROS works behind the scenes whenever you load any Steinburg-Jones package. IT has no editor as such. In fact, if I am not mistaken, Cubase itself needs M-ROS to function properly (independent of their other packages.) HOWEVER, M-ROS is a PART of the Cubase package and is not a seperate load.

There is another package distributed with Cubase called "Switcher" which allows you to load multiple programs and have them run simultanteously. It is limited only by resident RAM(no swapping capabilities that I know of-- though newer versions of Cubase have loadable modules to aid memory crunches.) This would be the closest thing to an editor for M-ROS that I can imagine. Essentially it's a menu screen that you call up using an alt-key combination. You can also jump directly to other programs by using alt-#.

Switcher is primarily intended to be used with Steinburg-Jones software though it will work with others. (I have, for example, run Word Perfect simultaneously with my Cubase without any trouble.)

BCnya,
Charles O. Onstott, III

P.S. Even if you meant M-TOS, I thought this might clear some things up for those who weren't sure what it was.

P.P.S. If you're in to MIDI and don't have Cubase, you're not really in to MIDI. Rush out and buy it as soon as you can-- it's phenomenal. (Also, the only reason

why I keep my Atari.)

Hello, I just got my new high speed modem. It works great, but occasionally will loose text on long screen dumps, etc. I have tried XON/XOFF and hardware handshake, but neither seems to help. I have this same problem in both Spectre and Mac (Spectre GCR) modes.

How do you folks with Fast modems have your comm. programs setup?

I am using Uniterm with a 1040stf (old) and Digicom Scout Plus modem.

(I have same problem in all programs that I use in both Spectre and Mac mode.)

thanks......

OS/2> altogether a true statement -- one of those claims that _should_ be followed by
OS/2> a little asterisk for disclaimer. Anyone?

He is talking about the DX2 66mhz chip. It runs at 66mhz internally and
33mhz externally. That way, a person who has a machine with a 33mhz bus can
pop the new chip in and get a vast improvement in performance. Depending
on what kinds of applications you run, the actual performance boost
varies. For me, I noticed almost a doubling of performance in ray tracing
(under OS/2), but no big shakes for spreadsheets and word processing.
However, it seems to make a HUGE difference when I'm running unix on my
machine. Processing 500K of compressed news batches only takes about
a minute and compiles are very fast.

This clock doubling technology thing is nothing new. Motorola chips
have been doing it for a long time...they just don't make a big deal
out of it.

The bottom line: If you don't have any heavy math or mpu piggy
programs to run, you're probably better off spending your hard
earned bucks on a faster hard disk or more memory.

Cheers,

Chris

The "problem" is that STalker is TOO compatible with GEM. If it
weren't written for maximal compatibility with all sorts of STs, it
would be quite possible to make it faster.

It wasn't designed PARTICULARLY for speed, but rather to actually
WORK.

Most of the OTHER terminal programs aren't too happy about running on
systems with any kind of special graphics hardware, for instance.

>> If you only have an ST, use Uniterm, you don't have the speed or need for
>> anything more.

>> (whose VT100 is pretty good when you set it up right,
>
>hah! unless you don't want lines over 80 chars displayed correctly.

Unfortunately, that IS one of my gripes about STalker. A terminal program can't be completely compatible with BOTH GEM and VT1xx at the same time, without making SOME compromises.

>> CoNnect, which is as close to flawless as I have ever seen a
>> terminal emulator get.
>
>Does it have an editable capture buffer with word wrap?

No, but you can use almost any text editor to edit captured text while it's running.

I use Sudden View; others may prefer other editors. The really GOOD thing about it all is that CoNNect doesn't try to be a text editor as well as a communications program.

>Is it as fast as Flash 1.6?

No, but then it uses GEM, and Flash doesn't.

Does Flash 1.6 use GEM, or does it do arcane things that make it incompatible with newer hardware?

>I get the feeling a lot of people use term programs to just dial up
>bulletin boards in TTY mode, without ever using a real editor or
>something that requires vt100, and then telling me about vt100 emulation.

I'm sure you're correct.

However, there ARE some of us that require proper VTxxx emulation. I'm currently editing this message using GNU Emacs, and it requires better than VT52. I usually emulate VT220 using Uniterm, and that works extremely well.

Important point: Under UNIX, you can make almost ANY kind of terminal emulation compatible, so long as you set up a correct TERMCAP entry.

Flash was one of the programs that actually included a set of TERMCAP entries;

Uniterm does flawless VT52/100/102/220 emulation (as far as the standard TERMCAP entries are concerned), and thus doesn't need any kind of special TERMCAP.

CoNNect also seems to do pretty good emulation of VT52/100/102/220 and I think VT320, and correspondingly doesn't require any modified TERMCAP entries. Depending on the screen size,
stty rows xxx columns xxx may be needed, but even THAT is done in "standard" fashion. GNU-Emacs was quite happy with the way CoNNect did this.

I expect that all that STalker needs is for someone to come up with an appropriate TERMCAP entry, to make up for the "lies" about its VT100 emulation.

For the price of the Profibuch (80.-DM ~ $50 per 1200+ pages) you should
be still 'liquid' (in money terms) enough to also buy a German dictionary.
This way you'll learn some German, which will be for your future
career probably even more profitable than knowing the VDI calls. (har)
Since most of the stuff you can guess, (like what's Malloc gonna do ??) and
the jargon draws quite a lot from English, this I think oughta be feasible.

(I had to read english manuals from the tenderest age, there was nothing
else available (sob))

So, Mr. CS Expert, why don't YOU tell all us ignorant folks what TRUE multitasking is, instead of blasting somebody who at least has part of it right? Why not explain why "multiprocessing" keeps being invoked here, when essentially single processor systems are being discussed? I always thought Unix was a multitasking operating system, since it can run 2 or more processes simultaneously. True, it is unequal sharing due to process priorities, and there is also overhead to consider, but one component of multitasking is certainly the ability to run 2 or more processes (or tasks) at the same time, at least as it appears to the user. Sure, this has to be time-sliced on a single processor system so it's only apparently simultaneous, but the comment on halving the time should have given you a clue that multiprocessing was not being discussed. The Falcon may have a couple coprocessors, but I wouldn't characterize it as a system capable of TRUE multiprocessing, so I can't understand why people keep bringing it up.

If you have something useful to contribute, please do so; but sniping at someone who doesn't have your obviously superior background in Computer Science without sharing your expertise seems a bit nasty, IMHO.

Source record: 211486
Cross-posted to: comp.sys.atari.st,rec.games.hack

[Atari ST specific message here... Most rec.games.hack readers can
ignore it.]

NetHack 3.0j (Atari version ported by Eric Smith) works quite nicely in
a TOSwin window under the MiNT multitasking kernel...

Now all we need is for someone to create a GDOS font something like the
one hackfnt.prg installs... I'm going to make a Warp-9 version of that
font for users of this excellent screen accelarator. I'm afraid it
won't make things look any nicer under TOSwin, but...

If anyone knows of any GDOS font creation utilities, or if anyone would
like to volunteer to create a GDOS font for NetHack, _please_ email me.
Thanks.

But.. fact is that the "general" group contains much (?) more than
just the flamewars, and of course there are people who want to read

Somehow, I doubt that thousands of votes would be a problem. Most votes are big if they get 400. Obscure, low interest votes like this would be hard pressed to pass the 100+~ plus rule.

>So, before I give it a try, is there anyone else willing to do this?

No, I have kill files.

I know the attribution's screwy here, but one point I'd like to mention in case it actually makes it to an official RFD. If an advocacy group is formed, it should probably be called comp.sys.atari.advocacy, as the atari hierarchy will be the root if the falcon arrives, and I'd hope it doesn't make sense to have a seperate advocacy group for the falcon. In fact, after the Falcon is released, I'd expect traffic in the *.st groups to diminish.

>
>sincerely,
>Chris

Don't worry about it smashing your hard disc. It simply replaces all the slower GEM disc access routines with faster assmebly language ones. You'll love it since it turns your hard disc into a speed demon. It also eliminates a lot of the TOS bugs like the infamous 40 folder limit.

The multi tasking is really just a potential. It provides the pipes and speed needed for effective multi tasking. Software that takes advantage of this is supposed to allow multi tasking.

The only problem I had with PowerDos is with programs that like to be at the top of RAM (like CodeHeads RAMdisc). PowerDOS won't let these load after it, so you will have to put any programs that must be at top before running PowerDOS.

There was a very interesting tv program on recently about Japanese trade practices and how they are making it very hard for Americans to break into their own markets. One case in point stood out - a new hand held game system (don't remember which) was to be carried by Toys R Us until Nintendo stepped in threatening supplies of its entertainment systems unless Toys R Us dropped the product.

Has Atari been stepping on Nintendos toes?

>>to engage in flamewars..

>Do you have a compatible? Are you involved in a flamewar?

Ah.. ok, I see I inadvertantly omitted a single word from that paragraph..

Let's see if you get the thought this way..
People who *only* own a computer in a
thriving, vital market have better things to do with their computers than
to engage in flamewars..

Yes, I own PC compatible computers, but I also own an Atari ST,
which is part of a dying, sickly market, and it appears I'm
engaged in several flamewars with people who seem to think that
spreading misinformation about other brands of computers is
somehow going to make everything in the Atari market suddenly
turn around and become respectable again.

It's akin to someone saying "I own a Yugo, and while they're
not made any more, and there are no dealers left to buy them or
parts and service for them, Pintos burst into flame, and Corvairs
flip over, so everything but Yugos sucks.."

1452. GIF viewers and GIF89a

Newsgroup: comp.sys.atari.st
Date: 1993-01-24 00:54:31 UTC
From: frank@jplpost.jpl.nasa.gov
Message-ID: <frank.26.727836871@jplpost.jpl.nasa.gov>
Source record: 211493

I've been putting together an anonymous ftp site to distribute, among other things, GIF files of images from JPL's space missions. Besides the picture files we would also like to offer people shareware/freeware GIF viewers for various platforms, including Atari.

From the faq for alt.binaries.pictures.utilities, I see some recommendations for Atari GIF viewers. However, it does not make it clear whether these viewers will work with GIF89a files; on other platforms, many viewers bomb when trying to view a GIF89a file. (The main thing about GIF89a is that the file contains an embedded caption in the form of a "comment extension block." Files under the previous GIF87a standard just had the image.)

I don't have access to an Atari, and so I wonder if anyone can recommend which GIF viewers do or don't work with GIF89a files. (If you need to get your hands on a GIF89a file you can visit our ftp site, pubinfo.jpl.nasa.gov (128.149.6.2); the GIFs, all of which are GIF89a with embedded captions, are in the directory /images.)

Thanks much if anyone can make any comment.

Frank
frank@jplpost.jpl.nasa.gov

Using 9600bps or higher, on Atari's, requires the program 'SERFX'
(or whatever it is). 'Serial Fix' just adjusts the Handshaking,
so it's a bit more stable!

(It works - if you don't have that, or Turbo-CTS, then get it!)

Should be available at all good FTP sites!

| >minimal real time (DM takes about four hours, maybe less for all I
| >know. No idea what Chaos Strikes Back takes).

Done that. DM takes a day (a weekend with one character). Chaos takes longer.
I had to spread it out over a couple of weeks. The problem with finishing
Chaos with one character is the area of demons at the end.

| Better still, aren't there some DM dungeon editors out there? I'm not sure
| if there are any for Chaos Strikes Back. ANYWAY, just get the editor, and
| MAKE yer own dungeons!! Much more fun that way!!!! Even better, make an
| impossibly hard dungeon and get a dungeon-aholic games player to play it
| and watch the expression on his face!!!!! B^D

Actually, I am one of the co-authors of the CSB editor that appeared on a
ST Format coverdisk 2.5 years ago, so I know how to edit the dungeon fine.
There are problems: you can't add pits, doors, transporters, objects or
wall features. You can't delete doors or transporters. So there is limited
scope for decoration. The only real reason for the existence of these editors
is cheating (printing maps, opening doors etc). That's how one of my
friends completed Chaos within 11 days of its release :-)

thanks to the folks who suggested that I use Serfix on my St.. it worked great to solve my handshaking problems with my new faster modem.

My next question is how can I get this same clean handshaking when I am using my Spectre GCR. Handshaking does not seem to work under Spectre either.

Can anybody suggest anything? Does anybody else have this problem?

.......thanks......
.....chris

P.S. I use Z-term primarily, but I tried others and had the same handshaking problems. My modem is a 14.4 baud Digicomm Scout Plus modem. My ST is an old 1040STf with old ROMs. My Spectre is version 3.0.

You could also configure your modem so that it won't hang up whern the
DTR-line is toggled. On most modems AT&D1 will accomplish this. The only
problem is that you then have to use +++ATH to hang up.
Stalker can be so configures that it wikll use +++ATH when you want to hang
up.

I am having trouble setting up mint to work with the Manager program. I want to be able to run something like TCSH in a window. I keep getting a "can't get a pky error" or something to that effect. I figure it isn't setting where to find the MGR program, and I am not sure of the proper set up for the mgr.rc file. I did manage to get it working once by putting it on a disk, instead of hard drive and both Mint and MGR in the same directory. It then loaded TCSH when I opened a window but gave a Mint error and crashed. Without manager I was able to get TCSH working. Any help would be appreciated.

Thank You,

I just ran ratehd on my Syquest. It does 34ms seek time and 497kps transfer. My quantum does 24ms, and 1197kps. I think the floptical would be a good backup device, but it's so close in price to a hard dirve i doesn't seem that cost effective.

If you do not want to do it yourself there is a great kit from "CT" in
Germany. I have written an article in Z*NET back in 1989 about how to
convert your ST to an IBM case and the pros and cons.

This is why I jump into the Atari is NON upgradeable flame all the time.

There is a PD spreadsheet program called "Sheet". It works well enough
for most applications. We used to use it at our old user group for
accounts and I think the chaps still use it for that purpose and also
billing for the PD libary.

> if possible, drop carrier, and run itself again.

Try this (not tested):

```
:1
hangup()
echo('\r\nWaiting for Ring\r\n')
if(!get('RING',10)) echo('\r\nNo Ring\r\n') jump(1)
send('ATA\r')
if(!get('CONNECT',20) jump(1)
send('Text whatever you like\r\n')
hangup()
jump(1)
```

Modem must be configured to send the needed strings !

Sure, a German dictionary might do it for many of those out there. Still,
there is a motivation problem. A lot of people out there just don't want to
go and pick up a dictionary to read a book.

What about if some of us who can I/O both German and English volunteered to
translate a chapter each...??

1475. Help setup modem

Newsgroup: comp.sys.atari.st
Date: 1993-01-24 17:51:05 UTC
From: tb1153@csc.albany.edu
Message-ID: <TB1153.93Jan24175105@thor.albany.edu>
Source record: 211375

A friend at SUNY-Albany would like to use his 520ST as a terminal to work off the school's UNIX cluster. I have been pleasantly surprised by the machine but don't know anything about it.

1. What cable should be used to connect the 25-pin "modem" port to the external Hayes-compatible modem?
2. Is there shareware that can enable him to emulate a VT100 and use Kermit protocol?
3. Where to find good shareware.

He has a double-sided 3.5 inch disk drive, which I assume is 720K. A user in the Netherlands tells me that the machine could probably read IBM formatted disks (since I will have to download it and get it to him somehow).

All help appreciated.

Not only is there no money in designing Atari software for the commercial sector, the software tools are not as good, in fact pitiful if you consider what the PC and Mac have. Right now, I use Turbo C and thats a very fine environment but its bare minimum now, 3 years ago it was great!

Thats a shame...

>

I believe that some high end modems already do that. From what I understand the high end Zyzel (?) modem has two cheap DSPs, a 68000 and a ROM. A modem upgrade usually consists on buying a new $35 ROM. Of course the modem is expensive to begin with....of course it's also really cool..fax modem, alternate ring detection, caller ID, supposedly can digitize incoming voice messages...wish I could afford one.

I have heard that there is doubt that the 56001 could do a 9600 baud modem and do error correction and detection at the same time. Anyone know for sure? I've heard plenty of people talk about implementing a modem on the 56001 (when NeXT debuted the slabs, when Cork was talking about releasing an Apple CI clone w/DSP, now, and at various other times in between....) but have never heard of someone actually *doing* it. Does anyone know (with some degree expertise) just how good a modem the 56001 could make? If it isn't at least 9600b with V.32,V.42 then by the time you bought the program and bought the hardware to hook up the phone, you would probably be getting into the price range of a real modem.

I really like my SupraFAXmodem with V.32bis, so I'd recommend it. You could also go for the slower speed version with V.32 (9600).

Charles Smeton, the programmer for Joppa's Straight Fax, recently bought the rights to it and started his own company, NewSTar. Support on GEnie is excellent. Unfortunately, I don't have a phone number or address for it. It's good software too. :^) I'm not aware of other fax software for the North American market.

> of the Lynx? Toys R Us has over 35 percent of the toy market; the
> toy market is a multi-million, if not billion, dollar a year
> product market. And Atari lost this major business account.

Pattie,

Who the heck is this little American firm called Toy R U (grin).
Please remember that Atari have a global presence in the market
place and just beacuse the USA is not doing so well, try to
remember there is LIFE outside your borders.

Here in Asia Pacific (the real one not California USA) the Lynx
was the most requested xmas present for children 3-15yrs and large
volumes have been sold over the xmas period. The same goes for
Europe from the conversations I have had with friends up that way.

Like it or not (and most of us are NOT) Atari has a firm footing in
the home console/games/video games industry (read the news.groups on
internet to get an idea of HOW big) and if they are to claw their way
back to a firm footing this is an ideal vehicle in which to do it.

We in this news.group use the st(generic term) series of computers
made by the same company. Therefore sometimes it is hard for us the
users to see the wood from the trees and tend to forget if the sales
of a product are no good, commercial realisim says stop supporting that
product line. This maybe why there has traditionaly been a so called
lack of support in the USA for the st series of machines due to lack
of market penitration (who knows I like others am only commenting on
what I have seen) and Atari not going at it with the ST/STE/TT and
the likes where they have in other countries that have proved to be
profitable.

Back to the subject at hand.

If you and your magazine were to ask Atari how many Lynx's have
been sold on a GLOBAL basis (out side the back yard USA) you might
be in a pleasant suprise.

1482. Weird question about the parallel port

Newsgroup: comp.sys.atari.st
Date: 1993-01-24 19:24:40 UTC
From: jthomas@access.digex.com
Message-ID: <1juqdoINN6c2@digex.digex.com>
Source record: 211357

I'm using Spectre GCR to do a lot of Mac word processing, as well as downloading things from my local Internet provider. I rely on the fact that the Spectre software turns the Mac serial printer port output into parallel output on the ST's printer port. Running MultiFinder I can print in the background over the printer port and download at the same time. I want to go to a serial printer (well, it's more complicated than that, but I'll explain later), and I'm wondering if I can keep using the printer port, running the output through a parallel-serial converter.

Has anyone used a parallel to serial adapter on the Atari printer port to drive serial devices?

I know Spectre internally converts the Mac OS's serial output intended for a Mac printer port into parallel output, but is anything done for input? Is this even a reasonable question? (I don't know of any bidirectional parallel devices, although I have seen ads for bidirectional parallel-serial converters.)

The GCR manual doesn't go into a lot of depth as to the nature of Spectre's internal serial-parallel conversion. A one-way (output only) conversion would be sufficient to drive parallel printers, but wouldn't work at all if I tried to hook up a serial device that needed to be able to talk back.

(Actually, my ultimate goal is even more complicated, involving directing Spectre printer output through a null-modem cable into a 486 box running a Unix clone, where a daemon process will handshake like a LaserWriter, accept the PostScript output, and pipe it to GhostScript, a free Gnu Public Licensed PostScript emulator... but that's some time in the future)

Joe

I'm pretty sure .au is the format for Sun workstation sound files...
Dave Baggett wrote a .au to .spl (Atari format) converter, and it's in
his digistuf.arc on atari.archive.umich.edu in Sound/Players.

Most of the will do something like that, or at least drop the price of the
system by the price of DOS/Windoze.

Some will put unix on it for the price of the system software...

There is a PD program that converts GIF-89a into 87a format. 89-a
really is pointless, as it seems to make no difference at all in the
size or structure of the GIF file that actually make life easier.

WHat actually *is* the difference between 89a & 87a!? (Apart from
the 89a etc. at the start of the file...)

You should be able to get a 9600 fax/modem send& recieve fax&modem
at 9600bps, for around $500 max' these days. (Or, for as little
as $250). Joppas ST-Fax or whatever it is, is practically the only
fax software for the ST - so the only way you can use a Fax-Modem,
is to attempt to find this, and fork out more money for it!

Meanwhile, the Am*ga has PD software which does the same. (And one
wonders why there is more for the thing!? 8-(

> says its 360DPI, but is the quality good.

From what I've seen of Cannon BJ printers, I'll stick with my "merely"
300dpi HP Deskjet 500. It doesn't cost any extra for a sheet-feeder,
it'll hold 50 pages in the input and output trays, it's _really_ easy to
refill the ink cartridges (saving you anywhere up to $20 over the cost
of a new cartridge), and the output is barely distinguishable from most
300dpi laser printers.

From what I've heard on GEnie, the BJ is nicer for printing text, the DJ
for printing graphics... Since most of my output comes from PageStream,
the DJ was a clear winner, IMHO.

You should be able to find a used DJ for $300 or $400; many users
upgraded to the colour deskjet (Deskjet 500C or the new Deskjet 550C).

Who's going to see it other than current Atari users?

Atari needs to put a two-page spread into BYTE or MacWorld/MacUser (I've seen adds from _IBM_ [not cloners] about multimedia systems in the Mac magazines) or something. With the dwindling numbers of current Atari users, the Falcon is going to FLOP if we're the only ones that know about it.

Well, given the state of the US economy (and ours, courtesy of Free
Trade), it might not be such a bad idea... Stimulating sales of
something should be more important than playing, "We'll bomb you at
will! We are POWERFUL! Bwa-ha-ha..."

Hmm, maybe this should be in alt.fan.desert-storm or whatever...

> altogether a true statement -- one of those claims that _should_ be followed by
> a little asterisk for disclaimer. Anyone?

Like the Motorola 68040, the "dx2" '486s run at twice the speed
internally. Thus, a "'486dx2/66" is a 486/33 running at 66Mhz inside
the chip, which will speed things up a bit. Not 2x, but...

You could also call a 68040/33 a "68040dx2/66" if you wanted, but
Motorola has never tried to make the 2x internal speed thing a marketing
point. IMHO, a more honest approach.

The trick was to click on the disk icon when presented with the disk
format dialog box. I tried it and it works. Under system 7, however the
feature has been (apparently) removed.

I saw a falcon running the ST high mode on an SC1224. Frankly, it just
didn't cut it. The dot pitch of the SC1224 is just too coarse to display
this mode. On a .28mm VGA monitor, monochrome should look just fine. If
you've ever seen a regular mac II, it's black text on white background is
what 640x480 on a .25 dotpitch trinitron looks like. More than adequate.

From: bcc@lanai.Eyring.COM
Message-ID: <1993Jan25.003556.29820@fcom.cc.utah.edu>
Source record: 211378

We just bought some of Antic Software's going out of business stuff, but now have a minor problem: In the Cyber Control stuff there is a readme file that says, "The first thing you need to do is upgrade to version 2.02 of Cad 3D because most of this stuff won't work with version 2.0" (which is what we have.)

Is there a way for us to upgrade? Is there anyone left who still handles this package? Are Tom Hudson, Darrel Anderson, Gary Yost, or Mark Kimball around? We don't want to steal software, we aren't asking for anyone to pirate a copy of this stuff; we'd just like to know if it is possible to use what we bought.

Thanks!

I have to report dissatisfaction with their speed. While constantly assuring
me of ever-increasing ship dates, they strung me along for a long time while
I was waiting for my 20 meg hard drive. After more than a month had passed
since my order, they informed me that they weren't carrying 20 meg hard drives
any more. But they cut me a pretty good deal on a 52meg hard drive, and when
that sucker arrived, I was too happy to anymore curse. In the end, I guess I
was happy.

>
>It can't do general purpose processing, it's not a "math
>coprocessor", and it can't do anything to aid most programs.

And what exactly disqualifies the DSP as a general purpose computer?
It has a memory, a CPU, and I believe enough instructions to make it
capable of universal computation. Therefore, it can run any program
that your main CPU can run albeit in DSP assembler versus your processor's
assembler. It's about the neatest thing about the falcon... Alas in a year
or so everyone is going to have them and from the stats on the 56001
in the Falcon garnered from comp.dsp, they'll have a better one...
FYI Apple and Commodore will be putting in the AT&T DSP3210 chip into
their computers. It has full floating-point support and both address and data
bus are 32 bit. The 56001 has only integer instructions built-in and
I believe a 16 bit databus and 24 bit address bus... I also believe that
the price of DSP boards is probably about to plummet for everybody...
I'd wait and see what people manage to make them do before you make
any conclusions about their capabilities... I think one could put
together a really nifty pipelined graphics co-processor with a couple
of them....

It's going to be a good year for computers. I'd advise anyone ready to
upgrade to wait and see what everyone releases this year...

The only reason I thought I might not be alone with an unfortuneate experience with Carter Graphics, is that my friend, who got his SyQuest from them for his ST, said basically the same thing. I almost cancelled, and went to Toad, but the woman I spoke with there was so nice, that I felt bad. (Plus, I needed a CPU switch on the drive, so that I could share it with my IBM!)

>get it to him somehow).

That is true. For him to format it, depending on which version of
TOS in his ST he has, he may need to use a special format program,
on other ST's, just format from the desktop. If it's formatted on
the IBM then passed onto the ST it will be read in no problems at all.

Tell that to an ancient computer running a spectrometer in our lab.
Recently, it started behaving eratically (i.e. computes wrong numbers!)
When we called the manufacturer, they suggested we pull out the cpu card
and reseat all the socketed chips. It worked! We've had to do this
twice now. My guess is that it's due to oxidation on the contacts of cheap
sockets. Anyway, the moral is that
although what you say is true for semiconductors, it is not always true
for the conductors (mechanical conections).

This thread about cheap PC clones is interesting. I remember when I bought
my brand new 1040STf years ago that the first one didn't work right. The
dealer then suggested I give it the twist (grab each end and twist) which
he found works most of the time to seat some socketed chips inside. At the
time, there were complaints here in this newsgroup about Atari using cheap
sockets. Back then, Warwick's statement was being made in flame wars by
PC clone and Macintosh advocates about the Atari ST.

Go on then. We're all standing here waiting for you to either do that,
or stick your other foot in your mouth.

>The Falcon is underpowered/overpriced... oh, I said that already. A
>few times an article, I think...

Because you keep ignoring the DSP.

I understand you. If the Falcon didn't have the DSP, I wouldn't by it.
It would be underpowered and overpriced.

Steve Wells asked about the difference between the GIF87a and GIF89a standards...

I don't have a full list of the enhancements right here, but some of them include:

The ability to include comments with the picture, which allows giving credits and a description, among other information...

The ability to include animation (although I've only seen this done a very few times).

The ability to include more than one image in a single file...

I know there are more, but those are few of the changes.

>And what exactly disqualifies the DSP as a general purpose computer?

It's optimized for a fairly restricted set of operations, that's all.
Yes, it's Turing-equivalent, but that doesn't mean the constant factors
are small. :) The point is that while you can do "general purpose"
things on a DSP, you're probably better off doing those things on a CPU
that is optimized for "general purpose" things. In other words, don't
use your DSP coprocessor for your B-Tree algorithms; your 68030 will
run them faster.

The other issue is, of course, I/O. The DSP is clearly a big loser for
general purpose I/O (e.g., files and screen RAM) when compared to the
CPU on the motherboard.

>It's going to be a good year for computers. I'd advise anyone ready to

B
B
Distribution: comp
Organization: University of Toronto, Engineering Computing Facility

I have noticed that my ST produces some sort of pinstriping effect vertically across the monitor.

I have checked the monitor with another source, and so I believe it to be the RGB circuitry.

Someone has suggested to me that it may be the manner in which the R, G, and B are output.

Does anyone have any idea what causes this, and how to correct it?

If you have an answer, it would save me a great ammount of time!

awest@ub.d.umn.edu (The Piano Man) writes:
>
> First, what is a "RAM-disk" and how do I create one?

A RAM disk is a clever little program that fool your st into thinking it
has another drive connected when in fact the drive in a block of memory.

This is *very* simplistic, but the principle is that because a ram-disk
is in memory, access is *very* fast. You can get alot of different ram-disk
set up programs, which offer various features including reset-proof
ramdisks (remember memory gets wiped when you turn off, so copy everything
you want off of the disk before you switch off!) so that you can recover
your ramdisk after a reset (pretty handy).

> What programs should I use, and where are the directions for archivers for
> .lzh files?? (I just want to extract them!!!)

.lzh files need the lharc.ttp program, most pd archives hold at least
one version of this program. lancs.pdsoft in the uk have it, atari.archive
too, look in your nearest local archive.

(With apologies to those who read this group for informative articles)

A friend of mine was told these 'facts' at his employee induction course with
a clone manufacturer.

"IBM has so many employees worldwide that if they were all in one
place and that place was called a country then it would be the fifth
largest country in the world."

"IBM has so much money in the bank that the interest alone can pay
those peoples wages such that they could stop making computers
tomorrow and still keep everyone in a job if they had a mind to."

I dunno how true these statements are but even if there is some truth in them
then I doubt that the financial loss will hurt them much.

Isn't that a *big* ignorant? Just imagine, you want to spend 50 bucks for a
book in e.g. chinese or russian, can't speak the language and say that's
cheap? You even would by a even more expensive dictionary and a grammar
book to learn the language from an instant?

Well, if you would do so, that's your problem, but it won't help our
english speaking friends.

English is established as the international language for scientific and
computer science books, that's because english is a language that is
spoken world wide. And that's why computer books are usually written in
english.

>This way you'll learn some German, which will be for your future
>career probably even more profitable than knowing the VDI calls. (har)
I would doubt that. You judge again without evidence.

>(I had to read english manuals from the tenderest age, there was nothing
>else available (sob))
That's right, maybe because the computer science language *is* indeed
english.

|> << -- >>

OK, here's a few, not so much what I'd like to see, more what you could do anyway:
(Leaving out dtp and wordprocessors because I can't imagine trying to
write these would be anything but boring).

Along dtp lines, how about something which will read in a picture/image
colour/greyscale display it on any monitor/mode allow loads of image
processing to be done and then output it in a format which all (most?)
dtp/document applications can cope with. There seem to be a few commercial
things around of this kind.
Continuing with image processing, what about a character recognition program?
Should be quite good fun.

You could also try for an object drawing package. I'm sort of having a bash
at this myself, but I've got side tracked now by omega... It's not boringly
simple if you've never done it before (grouping objects/changing their positions/
etc.)

One other thing I can think off, especially now that you can just feed
sound directly into a falcon, and that's something which will process
sound samples (off line), to clean them up, alter/edit them etc.

Well there's loads there, generally quite a lot of work involved, but
you did say "applications" above.

Just what is the (approximate) installed base of Ataris and about
how many people are using them? (Surely this can't be an FAQ.)

(BTW, if the sound on the Falcon is as good as the claims made for it,
it should have a natural market among audiophiles.)

Hokay, first I asked for a program to convert IFF's and GIFs to ST/e.

I got Photochrome 3.

Excellent utility.

Now, is there a program out there to do the reverse, i.e. convert SP?, PCS pictures (ie. spectrum 512/4096 and photochrome 19200/32768 col pics) to The Amobeas IFF?

There had better be, as a certain Amobea owning friend of mine is getting paranoid, thinking that STE is a greedy machine who only takes, and doesen't give!

Thanks in advance for any help given....

Programs that should be using the blitter, but don't.
Eg. copying areas of memory, drawing sprites, scrolling in a window, etc.
(The blitter has 32-bit access and is faster at doing this sort of thing
anyway).

Erm, read the value in the address that holds the screen raster line position? I don't know the exact address, but no doubt someone will.

The MFS option is greyed out if your partition is too big - you must
first prepare your 4ish meg. TOS partition, _then_ go to Spectre.
Transverting to hard disk is great. But I STILL do not understand why
I could transvert to my MFS partition on my Mega ST, but cannot on my TT :-(

Why buy a falcon seems to be the hot question nowadays...

My reason will undoubtly be the soundspecs. Too bad CBM didn't include better sounds in the A1200...

Anyway, do anybody out there have any serious info on when atari will release the machine? I'm getting a bit bored waiting for it (dreaming?)...

/Da Wooom

In article <74048@cup.portal.com> Bob_BobR_Retelle@cup.portal.com writes:

Other things to try.. take a party through the game using
Magic only.. or try using Fighters and no magic..

(And if you're a REAL Dungeon Master "Champion", you'll know why
those ideals can't be reached... though it's fun to try.. :)

No magic obviously won't work, the Zo Kath Ra spell is irreplacable.
No fighting I'm not sure about (though if you include hacking through
doors as fighter skills then you certainly can't do without them). You
can't complete level 9 without using Ninja skills. Priest skills are
probably dispensable if you're prepared to sleep a lot.

Just for fun, I recently started a new party, and went through
the first six levels without using any weapons... it's VERY
interesting trying to kick Purple Worms to death..!
My characters were all pretty high level Ninjas by the time they
got to Level Six... (Had to use magic though.. kicking a Wasp
to death is no fun, and the "Green Ghost" banshee on Level Four
can't be touched without magic...)

Ah, but in a minimal real time attempt you simply dodge the banshee.
Ditto most of the purple worms. Indeed, if you hide in the screamer
regeneration room after releasing them from the end of level 4 there's
a good chance they'll all go straight past.

And yes, Chaos Strikes Back can be won with just one reincarnated
Champion... "Raalf, Bad Dude of Romulus" (a Detroit area "inside
joke") had some bad moments all alone there now and then, but
in the end, Balance and Good were restored to the world...

Now, that's interesting. Defeating the initial set of worms must be a
bit close, or can one hide from them for a while. And can one complete
the game without needing to fall through the floor at any stage (which
would be bad news for a low level character)?

Dunno about speed... knowing where you *have* to go, and where
you can avoid going would help a lot... although that also
results in much weaker Champions from having less combat
experience (though if you know enough about the Dungeon to
avoid places that aren't necessary, you'll probably know enough
to keep your people alive, even if they're weaker..)

Yes, knowing where to go and what is necessary is the key to rapid
completion.

I visited Toad Computers on Saturday and asked about the Falcons. The
lady working the store at the time (Jennifer?) told me thay have not
received any Falcons to resell yet let alone any demonstration models
from Atari. She went on to say that they set up a Falcon every
Thursday (?) but that it's borrowed from some individual.

1534. Falcon & Jaguar news

Newsgroup: comp.sys.atari.st
Date: 1993-01-25 14:13:54 UTC
From: evilandi@vnet.ibm.com
Message-ID: <19930125.081506.274@almaden.ibm.com>
Source record: 211426

Page 374 of Teletext On 3 (the data service provided by the UK's ITV television network) today features a brief interview with an Atari UK spokescreature.

It said that Atari is currently *stockpiling* Falcons rather than supplying them before the March launch date, so that there will be plenty of stock ready.

The Jaguar was said to be nearly ready; it is a cartridge console with custom graphics & sound chips, and will sell for UKP100-200 (USD150-300). A summer/autumn 1993 launch is expected.

Can someone please post a 'review' (or just comment on) the game Hunter.
I am especially interested in how complex the game is (do you need to think about strategies when playing or is it just a shoot'em up), and how long its appeal lasts.

Thanks,

Jonathan.

Hello there,

I'm considering upgrading to an Apple Mac but I understand that there is a
plug in cartridge that will turn my ST into an Apple Mac.
My question is : How good is it ? How transparent to the user is it ?
Should I buy it or upgrade ?

Thankyou for your time (in advance),

Danny

>a Sound Blaster file, which is used to digitize entire songs.
In fact, you're totally wrong. .AU means a-law or u-law format, which is
a kind of logarithmically downscaling 12 bit to 8 bit. .AU is very common
on SUN SPARC stations and some other big machines.

> Is there anyone out there that knows of an ST player or convertor that
>can handle the .AU format?
a) Have a look at atari.archive.umich.edu, in atari/sounds or one of it`s
subdirectories. As far as i know, they have a convertor from .au to .snd .
(very noisy, though). It may be a part of the "digistuf" package.

get sox5beta.tar.Z from "ftp.cwi.nl" , compile it on your favourite
unix host or use the atari version of GCC and it`s utilities.
SOX can convert between almost any sound format, including sone very common
formats from DOS, UNIX, PC and MAC, and does a very accurate job.

Hope this helps

Frank

I finally made my choice. Things turned out a little more expensive than I had first hoped, but I'll soon be getting a 85mb Data Pulse + drive (cost just under £400). Speed was very important, and I didn't really want to find myself running out of space, so 40/50 meg drives were out too (I couldn't get hold of them if I'd have wanted too). Of course, there's bound to be more problems in actually getting it... the path to hard drive ownership has not been smooth for me so far!

Thanks for the info folks,
Adam

I believe the *registered* version of Gemview 2.13 lets you save
in IFF, GIF, BMP, and some other formats. IFF and GIF would work with
your Amiga friend, and BMP would work with Windows, I believe.
Unregistered, you still could save as GIF...

1541. Re: KQ IV -software bug or just plain stupid??

Newsgroup: comp.sys.atari.st
Date: 1993-01-25 15:58:20 UTC
From: borrmann@Informatik.TU-Muenchen.DE
Message-ID: <1993Jan25.155820.18808@Informatik.TU-Muenchen.DE>
Source record: 211425

A few weeks ago I discovered that bug, too. But KQ IV and my Atari ST didn't crash throwing bombs. Kings Quest IV popped up a dialog box saying something like 'Oops! You've discovered a bug. Please contact the Sierra customer support' and after pressing the RETURN-key the program exited. Well, it seems this is indeed a bug! On the other hand the bug only shows up if you dig a hole in the cemetery at the wrong place (the program tells you, that you dig a hole and don't find anything of interest; after the 6th hole your shovel breaks) and look into the hole you just dug. To avoid the bug simply (???!) find out how to stop the baby ghost's fretful crying and/or where to dig (well, my guess. I'm stuck at that place, too): KQ IV only lets you dig in the graveyard if and only if you have visited the nursery while the baby ghost was in (and crying). It seems to me that there is still another (mother?) ghost in the room trying to quiet the baby because the cradle is rocking.

Alexander

1542. 1.44 MB drives on MSTE, just replace it !

Newsgroup: comp.sys.atari.st
